BURBOYNE COPPER PROSPECT - "T Claims" 827081 92I/3W

LOCATION: 92-I-3W

12 mi south of Spences Bridge

HISTORY: Soil sampled in 1969 by? a mag survey was carried out by? supposedly in the vicinity of the copper anomaly. Also some shallow trenches are reported.

GEOLOGY:

The property is supposedly underlain by Kingvale Volcanics + sediments which have been altered to chalcopyrite-bearing slain. The only assay reported was 0.73% Cu across 35 ft.

RECOMMENDATIONS:

The geochem anomaly (copper) has some very interesting numbers (up to 1700 ppm Cu) + is 3200 ft x \approx 2000 ft wide.

HOWEVER:

- 1) It is abundantly unclear whether Ashton was actually doing the survey over the Cu anomaly
- 2) His contouring ^{of the mag data} is out to lunch
- 3) The lack of lucidity ~~is~~ in this report makes it of little use.

Not worth pursuing.
