Dear Mr. Beaupre:

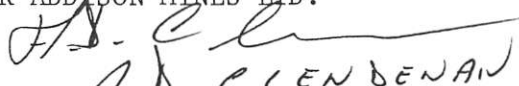

Further to our recent telephone conversation, I would like to examine your Blaze and adjoining claims near Mt. Valentine, Vancouver Island, on behalf of Kerr Addison Mines Ltd.

We agree to keep the data and information presented confidential and further agree not to stake or acquire ground within a three mile perimeter of your existing claims without your agreement for a period of two years.

Sincerely,

KERR ADDISON MINES LTD.

THE PETROL OIL AND GAS COMPANY, LIMITED

Table with 3 columns: 6 MONTH PERIOD ENDED, 30APRIL83, 30JUNE82. Rows include Revenue, cash Flow, Net Income, and Per Common Share values.

Note: The company's fiscal year end has been changed from 31December to 31 October.

BEAU PRE EXPLORATIONS LTD.

Table with 4 columns: Hole No., Intersection From, Core Length, Gold Oz/Ton. Includes text: GOOD GOLD ASSAY REPORTED Robert Beaupre, president of Beau Pre Explorations Ltd., reports some new results from the diamond drilling program on their Blaze claims in the Jordan River area of Vancouver Island, B.C., and also a corrected assay provided by the laboratory. This has increased the gold content of a 1.6-foot sample from 118 to 119.6 feet in diamond drill Hole 6 from the previously reported 5.468 ounces of gold per ton to 7.55 ounces gold/ton.

Mr. Beaupre points out that the 5-foot intersection from 662 to 667 feet in Hole 6 grading 0.095 oz.gold/ton is important as it represents a new mineralized rock structure below the amphibolite layer.

Where hole 6 intersected the new mineralized structure, the drill casing broke and the hole was abandoned. An offset hole will probably be drilled 10-feet to the east. Work is continuing. Assays are awaited from 500 feet of NQ core from Hole 21.

SKYLARK RESOURCES LTD.

TRENCHING & DRILLING STARTS - H.H. Shear, P.Eng., president of Skylark Resources Ltd., reports NEXT WEEK AT GREENWOOD, B.C. that a program of fill-in soil sampling and magnetometer and VLF-EM surveying has been completed on their Skylark property in the Greenwood, area, B.C., owned 70% by the company and 30% by Powergem Resource Corporation.

In the NW corner of the property, the survey delineated several magnetic and VLF-EM anomalies which are closely related and are associated with strong geochemical soil sample values in gold, silver, copper, lead, zinc, and arsenic. One of the new samples returned values of 70.4 ppm silver and 2170 ppb gold which translate to 2.1 oz./ton silver and 0.06 oz/ton gold. Trenching and diamond drilling will start in the first week of June.

Skylark recently received \$211,080 through the exercising of 689,000 A warrants and 137,500 B whereby 482,000 shares were sold at 44¢ per share. Earlier, Skylark received \$16,940 in February when 2,000 A warrants and 37,500 B warrants were exercised to buy 38,500 shares.

NEWS RELEASE*

Progress report on the continuing work of the BLAZE Group mineral claims located in the Jordan River area, Vancouver Island, B.C.. The BLAZE Group is still owned 100% by Beau Pre Explorations Ltd.

Some new results from the diamond drilling program are attached on Table I as well as a corrected assay increasing the Au oz/ton value of sample #93209 reported in May 12, 1983, from 5.468 Au oz/ton to 7.55 Au oz/ton. This is due to a better method of assaying of visible gold by the Laboratories.

Sample #D93222 DDH 6 shows a value of 0.095 Au oz/ton over a 5 foot intersection, this is important as it represents a new mineralized rock structure below the amphibolite layer.

Diamond drill hole #6 where it intersected in the new mineralized structure, had the drill casing broken at that point and the hole was abandoned. Plans are to drill it again, probably with a parallel drill hole set over to the side 10 feet East.

Work is continuing and results are encouraging. DDH #21 500 feet of NQ core has been completed but no Laboratory results are available as yet.

*This news release was prepared by Robert Beaupre President of Beau Pre Explorations Ltd. who takes full responsibility for its contents. The Vancouver Stock Exchange has neither approved nor disapproved the information contained herein.

NEWS RELEASE *

Work has been continuous on the BLAZE Group of mineral claims located in the Malahat Land District, Jordan River area, Vancouver Island, B.C. since the last News Release of January 17, 1983. The BLAZE Group is still owned 100% by Beau Pre Explorations Ltd.

The trench opened on the '36' quartz vein which showed the presence of free gold with assays of from 0.003 ounces gold/ton to 34.950 ounces gold/ton across up to 7 inches with significant values in the wall rocks has been widened and completely opened to allow detailed mapping and sampling. The broken material from the trench has been stockpiled for salvage and for test bulk shipments to a smelter. Seven grab samples of fines from one pile produced assays of from 0.003 to 0.305 ounces gold/ton. Lower grade material in other piles and in the vicinity of the blast area will be run through a newly installed large sluice box designed to collect fine free gold. The '36' vein and a number of other exposed subparallel gold bearing quartz veins have been stripped in preparation for further trenching and sampling.

The current diamond drill core program has just been finished with some logging and sampling to be completed. Eleven BQ and NQ size core holes totalling about 1273 meters (4,173 feet) were drilled along a strike length of about 300 meters including the trenched '36' and 'A' vein zones in order to test the structural continuity of the main veins along strike and to depth. Holes 12A, 12N and 15 at the east end of this test area have shown that the veins and vein systems extend over more than 130 meters of depth. In addition to the many new veins intersected by the drill program, visible gold was encountered in quartz veins in holes DDH-6 and DDH-15 as follows:

| <u>Sample No.</u> | <u>Hole No.</u> | <u>Intersection</u> | | <u>Gold</u> |
|-------------------|-----------------|---------------------|-----------|---------------|
| | | <u>From</u> | <u>To</u> | <u>oz/ton</u> |
| 93209 | DDH-6 | 118.0 | 119.6 | 5.468 |
| 61491 | DDH-15 | 507.0 | 508.4 | 0.098 |

.....2

Assaying has been a continuing problem with laboratory results generally failing to confirm visual gold intersections as indicated above by DDH-15. The high grade assay on visible gold in core from DDH-6 represents results of a revised method of sample preparation recently implemented to resolve this problem. Final assay results from the drill program will be reported when the results from all the holes are available.

The drill results have also confirmed the geological structure of the folded, structurally complex vein area mapped by E. W. Grove Consultants Ltd. and the fracture controlled high temperature alteration system postulated by our consultant. Further detailed geological mapping of the property has been initiated using two University of British Columbia geology students supervised by Dr. Edward Grove, P.Eng.

It has now been demonstrated by sampling, trenching and diamond core drilling that a large number of free gold bearing quartz veins form a subparallel system within a zone over 300 meters long, 200 meters wide, and 150 meters deep. This zone lies within a more extensive area outlined by surface prospecting which has been shown to have a length of at least 3000 meters and a width of 300 meters. The core drilling and geological evaluation has now also shown that the vein system is uniquely marked by extensive quartz, carbonate and magnetite alteration in the underlying folded amphibolite units and shows a similarity to a variety of Precambrian gold deposits.
