Webb

- 2 -

The results from all drilling conducted to date have confirmed the presence of a large, weakly mineralized copper zone within a favourable host environment. All of the holes showed chlorite and epidote alteration plus or minus minor secondary potassium feldspar. These alteration assemblages are indicators of a porphyry style environment.

The area of current drilling is overlain by approximately 300 feet of overburden. The overburden thickness decreases to less than 50 feet at the western claim boundary, approximately 1100 meters west of hole 90-M-4.

Management and their consultants are reviewing all information received to date and are in the process of formulating a Phase III program.

Grand America has now acquired an additional 20% undivided working interest in the Webb property and now holds a 50% interest. Moondust remains the operator of the project and will remain operator as long as it maintains an interest of 50% or greater in the property.

ON BEHALF OF THE BOARD

GRAND AMERICA MINERALS LTD.
