Dear Sirs:

Re: Pacific Eastern Gold Prospect
Bralorne Gold Camp
Lilloet Mining Division, British Columbia

I have reviewed recent diamond drilling data regarding the current program at the Pacific Eastern gold property southeast of Bralorne, British Columbia.

W. G. Stevenson, P. Eng., in a report date December 16, 1983, recommended a limited drilling program estimated to cost \$126,000.00. Recent geological interpretation suggests that best potential for significant gold deposits would be at depth or down plunge adjacent to the soda granite, in a similar geological environment hosting Bralorne and Pioneer deposits.

To assess this potential, deep drill holes of 800 to 1,000 meters are required. Recent experience indicates holes of these depths involve expenditures of \$80,000.00 - \$90,000.00 per hole.

In the writer's opinion, your company advisedly sought outside participation to ensure an adequate exploration program. Canada Tungsten Mining Corporation is committed to spend \$250,000.00 in 1985 as part of a two year commitment of \$1,000,000.00 to earn a 50% interest in the property.

Canada Tungsten's 1985 expenditures will result in three holes being drilled to test potentially favorable areas.

cont'd..

The first hole was abandoned at a depth of 256 meters in serpentine adjacent to the Fergusson Fault. Hole 2, recently completed at a depth of 854 meters, was a steeply inclined hole to the southwest. This hole passed through the Fergusson Fault and into Pioneer greenstones which are variably altered and bleached. Three narrow quartz vein zones, containing pyrite, arsenopyrite and low gold values (0.03 ounces/ton gold) were intersected at 303.3, 389 and 399 meters.

The presence of quartz veins, porphyry dykes and bleached greenstones in the last part of the hole suggests a significant hydrothermal system adjacent to the soda granite.

This environment will be further tested by an additional two holes.
