COMMENTS -- DRILL CORE ANALYSES -- GOLD DUST CLAIM

The best sequence of copper grades (0.123 - 0.235%) are from Noranda hole 2 drilled beneath the area of the best surface sample (0.20 oz/ton gold). Gold values in this hole however are low - 0.03 - 0.06 ppm or 50 - 60 ppb.

Only 6 gold values above 0.10 ppm (100 ppb) were detected. Highest value was 0.17 ppm (170 ppb; 0.005 oz/ton). These results are from Taseko holes 1 and 2 and Noranda hole 4 - all drilled in the area of the southern creek exposures. Only the Noranda hole shows a direct correlation between better copper and gold values.

While these results are disappointingly low, it is considered worthwhile to see if there is any recoverable sample material from Noranda percussion holes in the southern area - ie - holes 12,14,15,17,18,19,31,32. Any samples collected could be run for 31 element ICP along with the pulps from the drill core samples which I will get from Daryl Hanson.

I recommend that assessment work be filed for another year (\$4,000) with a report based on these and other analyses - Daryl Hanson advises that Equity's costs per sample are \$25 so we already have a \$1,000 "credit" plus my time and expenses to date. Only limited additional costs will have to be incurred.
