② MT-15: FRESH, FIG-M6. INTERMEDIATE  
INTRUSIVE. LIGHT GREY ON FRESH,  
HEMATITIC ON FRACTURES. SMALL  
LIM OF EYES & EITHER HB OR BT  
GRAINS. WELL FRACTURED.

③ MT-16: 200m east of MT-15  
SAME INTRUSIVE AS 15 - PERHAPS  
A LITTLE MORE AFFECS.

WHOLE HILLSIDE IS MOSS  
COVERED TALUS SLOPE, NOW  
W/ FOREST, W/ VERY POOR  
SOIL DEVELOPMENT.

Mike Thibe:

HO CLAIMS.

JUNE 11/84.

Mike G. & myself began dirt-bagging the HO/HUM claim groups today. The common line from the LCP to below the cliffs to the south, & three additional lines (100m ~~apart~~ spacing), east of the LCP, were sampled. Soils were gathered every 50m along lines.

Soil development in this area is very poor most of the time. Some stations ~~a~~ had fairly good B-horizon development. Moss cover up to 2' thick then often with a rotten wood layer & then talus (usually where soil attainable) hampered soil collection. Many stations had frozen ground. Basically the whole hillside is a moss covered talus slope that has <sup>probably</sup> not developed a very good soil profile.

Cliffs encountered at the ends of lines were of intermediate intrusive composition, fresh with Hematite staining on fractures. (f.g. to m.g.)
