M. Thibe

HUM

JUN 15 194.

Moved camp this morning down-stream ~ 1 km. Dave moved Mike & myself above treeline under prominent Sukla Fm cliffs south of camp.

Began sorting around 11:00 A.M. after taking a brief look at cliffs - not very interesting.

Soil development was generally good as we sampled ~ 200 m apart northward to camp. Soils were collected every 50 m. Rocks encountered along lines were Sukla Fm greywackes for the most part w/ some siltstone. Some intrusive rx were seen in talus when digging for soil.

In many cases B horizon <sup>occurred</sup> within ~~of~~ or just under a talus cover. Talus was almost always covered with a foot of moss.
