

Bremner Creek area

Upper members of Fire Lake sequence.

- fine breccia, thin andesite flows & sills, light grey rhyolite (breccia could be called gregwacke)
- massive rock, str. unknown
younger to N.W. due to rhyolite flows in breccia.
- lowest breccia has very fine matrix of re-crystallized feld & qtz.
some vague trachytic texture
- fragments include sandy argillite, meta-andesite, feld. porph, hornfels and minor arkose.
- fragments in breccia decrease upwards of rhyolite
extensive but low grade metamorphism
