

NOTES

8 June 78

WILLY'S FIRST CLAIM

(4 unit designated claim)

Location: 3 mi. W. of N. end of Yakoun L., Graham I.

Geology: This property seems to be on the same trend as the Courte - Riley, 3 mi to the NW. It is probably underlain mainly by Yakoun volcanics, but at least some carbonates (Kunga or Longarm) are present

Alteration: Generally of pyrite - clay - (CO₂) form. A prominent alteration zone cuts Nw'erly through sample # 199. Pale brownish weathering zones are present, as at the Courte - Riley.

Geochem: Au and Hg tend to be slightly to highly anomalous. The peak value of 1400ppb Au represents altered carbonate float. The 30ppb value (sample WH 78-21) is a silt from a major creek, and is therefore probably a subdued figure. The area is open to the E and sampling is lacking between this property and the Courte.

(6 other samples from same float or float group did not kick for Au)

Other: Access is excellent
