Dear Larry:

Enclosed is a summary of the original assays plus resplits for sample 113203H from certificate A8725023 dated October 21, 1987. The original pulp assayed at >10,000 ppb which was confirmed by subsequent re-assay plus re-screening metallics assay of the pulp.

Resplits from the reject material indicated lower, erratic values. It appears the gold in sample 113203H is very coarse causing an extreme metallics problem for assay.

The best value we can provide is the average of all assay done to date. The entire sample has now been prepared and assayed.

Please call if you require further discussion.

Yours sincerely,

Lloyd Twaites
Chief Assayer
