NEWS RELEASE OCTOBER 4, 1989

INDATA PROJECT

The 1989 exploration program on the Indata property, located north of Ft. St. James, B.C., has now been completed. The project entailed: geophysical surveying, geochemical soil sampling, geological mapping, backhoe trenching and diamond drilling. Forty-two trenches and 13 drill holes (totalling 6,000 feet) were completed.

The main zone quartz-sulphide vein system has now been traced for an 800 meter strike length. Drill and trench results on the main zone returned values from 0.10 to 0.29 oz/ton gold across intervals of 0.5 meters to 2.17 meters. Hole 89-I-6 intersected 2.14 meters of 13.79 oz/ton silver near the top of the hole, well above the mineralized structure; another hole from this area has been sampled in this interval to determine a possible extension of this zone. Previous drilling on the main zone has returned similar results with one high grade intercept of 20 feet of 0.92 oz/ton gold.

Trenching on geochemical and geophysical anomalies resulted in the discovery of three new vein zones. The Camp zone, 450 meters southeast of the main zone, has been traced for 300 meters along strike and has returned values up to 13.69 oz/ton silver and 0.124 oz/ton gold across 0.75 meters. Trench 22 yielded a high silver interval of 6.69 oz/ton with 0.065 oz/ton gold across 4.0 meters. The Northwest zone, 500 meters northwest of the main zone, was tested by three trenches and is characterized by two strongly altered shear zones within which easterly trending vein-sulphide occurrences were sampled. Sample results have returned 0.177 oz/ton gold across a true width of 0.7 meters. Four samples taken obliquely across the vein, over one meter lengths, ranged from 0.227 oz/ton to 0.382 oz/ton gold. A large number of anomalies have yet to be tested.

Extension of the soil sampling grid to the north and south has resulted in the delineation of a new 1,300 meter long anomalous zone which trends west-northwesterly and begins 500 meters north of the main zone. Recent follow-up on this anomaly has discovered showings of quartz stockwork and silicification in the volcanics, which carry substantial amounts of pyrite and chalcopyrite. Results from grab samples on these occurrences have not yet been received. An 800 meter long geochemical anomaly near the southern end of the grid was further defined but remains untested.

New grid soil sampling to the west of the main zone has resulted in the definition of a copper anomaly with dimensions of 300 meters by 800 meters. The northern end of this area was tested by two shallow drill holes in 1985 by a previous operator, and returned significant intersections of 0.1 to 0.2% copper. Re-logging of these holes has just been completed and determined that copper mineralization occurs throughout their length. Results of new sampling from this zone have not yet been received. Prospecting in the rest of the outcrop-poor geochemical anomaly has resulted in the location of a few scattered outcrops, all of which carry copper mineralization. It is noteworthy that soil copper values routinely exceed several hundreds of parts per million and commonly range in to the thousands of parts per million in this area. The company suspects that a bulk tonnage copper system may underlie this area and offers a significant new dimension to the property.

Mineralization on the Indata Project has now been traced along a strike length of close to five kilometers in the main grid area. Reconnaissance work indicates that this mineralized system likely extends much further. The company is pleased with the results of the 1989 program and believes that the extraordinary breadth of the system, and the diversity of the mineralization describe a good exploration potential warranting further persistent work. Initial technical discussions with Placer Dome Inc. have begun and will continue to late October, when all the data should be in and compiled, to determine the program for the 1990 season.

Eastfield expects to show a calendar year-end surplus of approximately \$200,000.00 which affords a comfortable working capital for the pursuit of other exciting exploration opportunities.

G. L. Garratt, Corporate Secretary
