

ROCK, LAD AND PIPE MINERAL CLAIMS

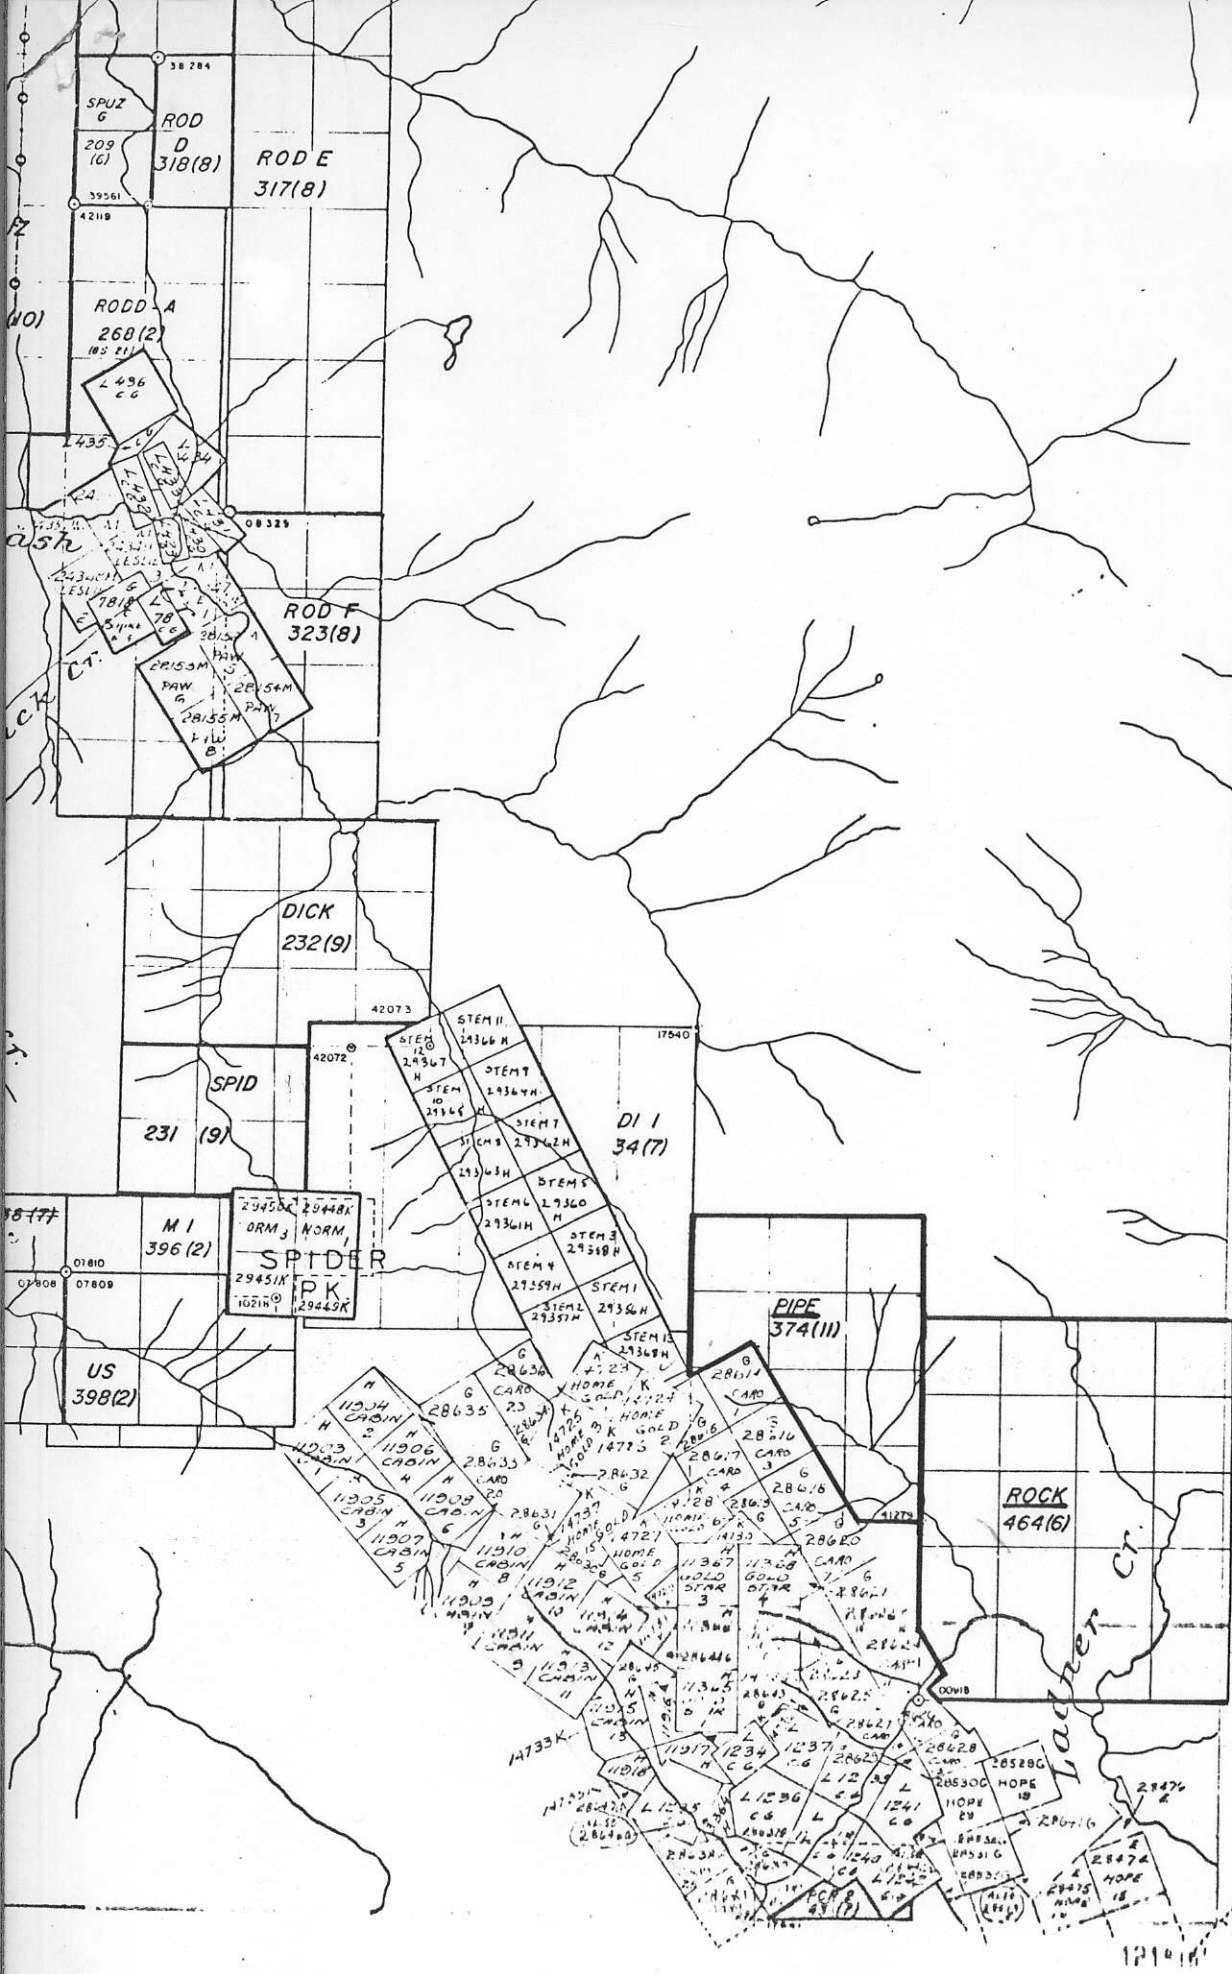

861549

The ROCK, LAD and PIPE mineral claim groups are located adjacent to the east of the Carolin Mines gold property in the Ladner Creek area of the New Westminster Mining Division (see attached Mineral Claim Map). A total of 44 legally located and recorded units comprise the claim groups (ROCK 20 units; LAD 12 units; PIPE 12 units), although portions of several units, totalling approximately 3 units in area, are on ground shown held in good standing by Carolin Mines.

The claim groups are held as joint property by Daniel and William Edward Blower, c/o 880 Rockheights Ave., Victoria, B.C. V9A 6J6. The ROCK and LAD groups are at present held in good standing until June 1980 and the PIPE group until November 1979 (see attached Record of Mineral Claim information). The claims have been held by the present owners since 1975, while previous to that, several claim groups staked under the old mineral claim system on portions of the property had been held for an unknown period of years by other owners.

Much of the property involves rugged terrain, although access to the southwest corner and along the eastern side is relatively good via logging roads stemming from the main Coquihalla River road (see attached topographic map). Trail access is available to the northwest corner via the old Pipestem Mine trail and the abandoned Pipestem wagon road. The old Pipestem Gold Mine is located on the northwestern edge of the property.

Mineralization and evidence of secondary oxidation is widespread throughout the claim groups although only a limited number of surface rock grab samples have at present been assayed for mineral content. The samples assayed were taken from a variety of random locations on the property and are not tied to a survey grid. The samples were assayed only for the presence of silver and/or gold values. Definable gold mineralization was present in most of the rock samples assayed although values are low (see attached Certificates of Analysis). However, as no geochemical or geophysical surveys have yet been undertaken on the property, and in view of the widespread surface mineral occurrences, the potential of the property has not been significantly tested.
