TARGET PROJECT W 117

THIRD QUARTER REPORT

JULY - SEPTEMBER 1979

TARGET PROJECT W 117

SUMMARY

THIRD QUARTER REPORT

The task of determining personnel activity during the third quarter of the Target Project during the quarter. Preparation of such all sampling is expected to be low on a monthly basis. In the Nixon area, the new work was not encountered.

Assessment was made of the SWAB group consisting of the separate survey and location mapping done there. The location mapping was performed for July, August, and September. The results were as follows: the work and preparation of the maps were completed. The estimated survey grid. The amount of work done was not yet been plotted.

An assessment of the field work during the quarter was made. The results were as follows: the work and preparation of the maps were completed. The estimated survey grid. The amount of work done was not yet been plotted.

A number of claims in the area were identified. The results were as follows: the work and preparation of the maps were completed. The estimated survey grid. The amount of work done was not yet been plotted.

The claim was identified in the area. The results were as follows: the work and preparation of the maps were completed. The estimated survey grid. The amount of work done was not yet been plotted.

TARGET PROJECT # 117

THIRD QUARTER REPORT

JULY - SEPTEMBER 1979

SUMMARY

Shortage of experienced personnel severely limited operation of the Target Project during the quarter. Prospecting and check silt sampling was completed to follow up on molybdenum-tungsten kicks in the Hixon area. This new work was not encouraging.

Assessment work was filed on the SWAB group covering the topographic survey and boulder mapping done there. Prospecting for radio active boulders was postponed for lack of crew. Early in September two geologists were assigned to this work and prospecting was done on a grid basis west from the established survey grid. Nothing of significance was found. The data has not yet been plotted.

An assessment report was filed covering the geological, geochemical survey done on the GREER claims.

A contractor, BEMA Industries Ltd, was engaged to drill percussion holes on the BIN claims in two areas where marginally anomalous soil results had been obtained in 1977. The claim group was reduced from 116 to 77 units and an assessment report was filed to hold these units. Soils were found to be compact tills, probably impervious, or nearly so, to ground water percolation.

Assessment reports, now available to the public, filed by Shell, E & B Exploration, and Placer in the Vanderhoof area were examined for possible information bearing on further work on the claim groups held in the area. Nothing to indicate significant uranium mineralization was noted.

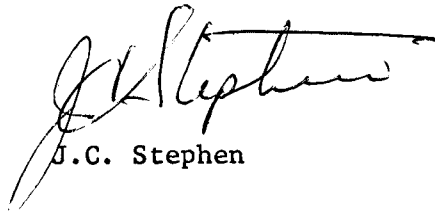

Copies of assessment reports prepared for the GREER, SWAB and BIN claim groups are forwarded as part of this quarterly report.

During October a small program of percussion drilling, using a Poinjar drill, is planned for the SWAB group. This will test the character of the soils in anomalous areas and particularly in the vicinity of the altered alaskite at the west end of the soil anomaly.

In answer to the requests received from the Royal Commission of Inquiry into Uranium Mining in British Columbia a summary letter was submitted dated September 3. Subsequently, September 19, copies of five assessment reports were forwarded.

Respectfully submitted,

J.C. Stephen Explorations Ltd.
