 Drilling on Davidson Project Expands New Gold Zone
 =====

SUN - Apr. 6/06

NR: 06-04

Silver Quest Resources Ltd. (the "Company") is pleased to announce significant drill results from the Company's recently completed diamond drilling program at its 100% owned Davidson Project in central British Columbia. The primary focus of the program was to follow-up drill hole DAV-05-02 (see news release dated November 3, 2005), which encountered a new zone of disseminated gold mineralization on the Davidson Project.

Partial results from Hole DAV-06-06 include:

Drill depth (m)	Intercept (m)	Gold (g/t)	Silver (g/t)	Copper%
67.0 - 75.0	<u>8.0 metres</u>	<u>10.70 g/t Au</u>	<u>42.8 g/t Ag</u>	<u>0.12 %</u>

Within the 8.0 metre interval reported above, a high grade interval includes:

Drill depth (m)	Intercept (m)	Gold (g/t)	Silver (g/t)	Copper%
67.0 - 69.0	<u>2.0 metres</u>	<u>35.35 g/t Au</u>	<u>153.0 g/t Ag</u>	<u>0.38 %</u>

This interval initially returned 35.90 g/t Au and 152.0 g/t Ag, with a check assay of 34.80 g/t Au and 154.0 g/t Ag.

The above intervals are within a larger mineralized zone of:

Drill depth (m)	Intercept (m)	Gold (g/t)	Silver (g/t)	Copper%
49.0 - 75.0	<u>26.0 metres</u>	<u>3.98 g/t Au</u>	<u>19.0 g/t Ag</u>	<u>0.10 %</u>

Hole DAV-06-06 was collared approximately 70 metres southwest of drill hole DAV-05-02, and was drilled at an inclination of -55 degrees, to a total depth of 157 metres. To date, assay results have been received to a depth of 119.0 metres. Based on a preliminary interpretation of the results of DAV-05-02, and DAV-06-06, the new zone of disseminated gold-silver mineralization dips steeply to the north and is hosted in lapilli tuffs, breccias and flows. As announced on November 3, 2005, Hole DAV-05-02 intersected, from 136.0 to 148.0 m depth, 4.93 g/t Au and 17.1 g/t Ag over 14.00 metres, within a larger zone from 96.0 to 160.0 m, 1.80 g/t Au and 6.5 g/t Ag, over 64.0 metres.

The Davidson Project is located approximately 100 kilometres southwest of Vanderhoof in central British Columbia, and approximately 450 kilometres north of Vancouver. As planned, two holes have now been completed (DAV-06-06 and DAV-06-07). Assay results are pending on Hole DAV-06-07 and on the remaining portion (from 119 metres to 157 metres) of DAV-06-06. A follow-up drill program is currently being planned. Details of additional programs will be announced as they become available.

The primary assays were performed by Eco Tech Laboratory in Kamloops,

and further check assays will be submitted to Acme Analytical Laboratories in Vancouver. Falcon Drilling Ltd. of Prince George is the drill contractor on both projects. Mr. Robert Weicker is the Qualified Person, as defined by National Instrument 43-101, for the Davidson Project and supervised the preparation of the technical information in this release and verified the scientific and technical information and opinions contained herein by reviewing the underlying data.

Silver Quest is an established Canadian junior exploration company with a focus on silver and gold projects, with nine mineral properties in B.C., Ontario and the Yukon. For Silver Quest property locations and information, visit the Company's web site at www.silverquest.ca.

=====
Silver Quest Commences Winter Drill Programs
=====

Silver Quest Resources Ltd. (the "Company") is pleased to announce commencement of a winter diamond drill program to further test the Company's Davidson and 3Ts Projects, both located approximately 100 - 120 kilometres southwest of Vanderhoof in central British Columbia, and approximately 450 kilometers north of Vancouver. The planned program of approximately 3,000 metres of diamond drilling over six to eight weeks will initially focus on the Davidson followed by the 3Ts Project. A winter camp established part-way between the Company's Davidson and 3Ts projects will allow streamlined access to both projects during the work programs. Falcon Drilling Ltd. of Prince George is the drill contractor on both projects.

Davidson project

The initial focus of the drill program will be to follow-up on the results of the Company's previously announced Hole DAV-05-02 (see news release dated November 3, 2005), which discovered a new zone of disseminated gold-silver mineralization on the Davidson property.

The discovery hole DAV-05-02 returned 1.80 g/t gold, 6.5 g/t silver and 0.12% zinc from 96 to 160 metres depth. The mineralized intercept is hosted by strongly altered (argillic, sercitic, variably siliceous) felsic volcanics, indicating the presence of a robust mineralizing system. The orientation and true width of the mineralized intercept in hole DAV-05-02 are unknown. Anomalous gold was first intersected at a depth of 46 meters in hole DAV-05-02; and core from a depth of 46 metres to the bottom of the hole at 236.5 meters, contained 0.81 g/t gold and 3.3 g/t silver across 190.5 meters.

Hole DAV-05-02 is located approximately 360 metres west-northwest of the closest previous drill hole, DAV-92-35, which was drilled by Granges in 1992. This hole returned 1.41 g/t gold and 1.8 g/t silver over 21.3 meters from 151.0 to 171.3 meters (end of hole) with a higher grade portion of 4.91 g/t gold and 1.9 g/t silver across 4.3 metres, from 167 to 171.3 metres depth.

Hole DAV-05-02 is located approximately 450 meters west-southwest of previous drill hole DAV-92-33, which returned 1.64 g/t gold and 6.3 g/t silver over 23 meters from 116 to 139 meters depth. This intersection includes higher grade intercepts of 2.03 g/t gold and 12.6 g/t silver across 8 meters, and 4.76 g/t gold and 64.8 g/t silver across 3.0 meters.

The target indicated in hole DAV-05-02 is a large tonnage, disseminated gold-silver mineralized zone that would be amenable to open pit mining and possibly processing by heap leaching methods.

Mr. Robert Weicker is the Qualified Person, as defined by National Instrument 43-101, for the Davidson project and supervised the preparation of the technical information in this release and verified the scientific and technical information and opinions contained herein by reviewing the underlying data.

Subject: Silver Quest Proposes Winter Drill Programs

SW - Jan. 24/06

=====
Silver Quest Proposes Winter Drill Programs
=====

Silver Quest Resources Ltd. (the "Company") is pleased to announce plans for a winter drill programs on the Davidson and 3T's projects. Both projects, located approximately 110 kilometers southwest of Vanderhoof in central British Columbia, are focused on epithermal gold and silver mineralization.

Davidson project

Applications have been submitted for a diamond drilling program on the Davidson Project. Permits are expected by early February, with drilling planned to commence in mid-February. The initial focus of this program will be to follow-up the Company's drill hole DAV-05-02 (see news release dated November 3, 2005), which discovered a new zone of gold mineralization on the property and returned an intersection of 14.0 metres of 4.94 g/t gold and 17.1 g/t silver, within a much larger zone of 64.0 metres of 1.80 g/t gold and 6.5 g/t silver, to a depth of 160 metres.

Hole DAV-05-02 was targeted on a coincident northwest-southeast-trending gold-in-soil geochemical anomaly and geophysical conductors. The host rocks are strongly altered felsic volcanics. The 14-metre intersection is comprised of seven samples, each two metres in length, ranging from a high of 9.81 g/t Au to a low of 2.67 g/t Au.

3T's project

The Company is also proposing a drill program on its 3T's project. Work to date by the Company has defined a combined inferred resource of 176,000 gold equivalent ounces on the Tommy and the Ted veins. All resources to date are above a flat-lying microdiorite sill, although drilling has confirmed significant continuity of the veins below this unit.

Drilling on the Ted Vein will follow-up hole TT-04-37 which represented the only hole drilled below the sill, and intersected a strong zone of gold and silver mineralization returning 3.74 grams per tonne gold and 59.3 grams per tonne silver, or 4.73 grams per tonne gold equivalent using a 60:1 gold to silver ratio, over 11 metres (true width 6.5 metres) at a depth of 399.3 metres. This intersection greatly expands the size potential of the Ted Vein both along strike and up and down dip, and indicates a strongly developed, robust epithermal vein system. A long section showing the position of the TT-04-37 intersection in relation to previous drilling on the Ted Vein is posted on the Company's website.

Drilling will also be completed on the Ringer Boulder target where previous prospecting has resulted in the discovery of multiple high-grade boulder occurrences, including the Ringer Zone (eight samples averaging 19.01 grams per tonne gold and 140.1 g/t silver). This program will be conducted in an attempt to locate the in-situ source of these boulders.

Subject: Check Assays and Further Drill Results From The Davidson Property

=====
Re: News Release - Tuesday, December 06, 2005
Check Assays and Further Drill Results From The Davidson Property
=====

Southern Rio Resources Ltd. (the "Company") is pleased to announce that check assay results have been recently received from drill hole DAV-05-02 from the Davidson Property. The primary assays were performed by Eco Tech Laboratory in Kamloops, British Columbia and the following check assays were analyzed by Acme Analytical Laboratories in Vancouver, British Columbia. As previously reported (see news release dated November 3, 2005) the Hole DAV-05-02 intersection, from a depth of 136 to 150 metres, represented a significant new gold discovery on this property.

Original Assays

Width	Gold g/t	Silver g/t
14.0 m	4.94 g/t	17.1 g/t

Check Assays

Gold g/t	Variance	Silver g/t	Variance
4.80 g/t	-0.14 g/t	13.2 g/t	-3.9 g/t

These check assays represent analysis of seven samples of reject material, with only minimal (-2.7%) grade variance indicated for the gold mineralization, well within acceptable Quality Control range. This intersection also returned strongly anomalous values of other metals including, copper with a maximum value of 0.20% Cu, and an average of 0.09 % Cu, and zinc with a maximum value of 0.27% Zn and an average of 0.17% Zn. Zinc and copper values are not directly co-relatable with gold mineralization and are distributed throughout the hole. These metal values, along with anomalous values of lead and arsenic, are indicative of a large mineralizing system with varied metal zoning.

The lower portion of Hole DAV-05-02 is also anomalous for gold values, returning 0.36 g/t Au and 0.7 g/t Ag over 76.5 meters, from 160 to 236.5 m (with the hole ending in mineralization). As previously indicated (news release dated November 3, 2005), Hole DAV-05-02 is approximately 360 meters away from the closest previous drill hole, DAV-92-35, which was drilled by Granges Inc. in 1992. This hole intersected 4.91 g/t Au and 1.9 g/t Ag over 4.3 metres, from 167.0 to 171.3 m (end of hole) within a wider intercept grading 2.48 g/t Au and 2.3 g/t Ag over 10.3 metres from 161.0 to 171.3 m depth.

Additional drilling is needed to confirm the geometry and size of this new gold target indicated by DAV-05-02. Further data entry and compilation of the Granges data is in progress, to develop a geologic model and indicate metal zoning, and a Phase 2 diamond drill program is proposed for the 1st quarter of 2006.

In addition, the Company is reporting the remaining analytical results from the other drill holes from the recent Phase 1 drill program on the Davidson Property. A total of 938.6 metres were drilled in five holes during September and October 2005.

DAV-05-01 - This hole was drilled to test an interpreted northwesterly trending fault structure, a magnetic contact feature and a VLF-EM

conductor in the Silver Zone. The Silver Zone was discovered and partially defined by a program of short reverse circulation drill holes, for which the Company does not have the data. Previous operators have described the Silver Zone as "a relatively flat lying body up to 70 metres thick and open to the northwest". DAV-05-01 intersected several zones of anomalous silver, gold and zinc mineralization including:

Depth (m)	Interval (m)	Gold g/t	Silver g/t	Zinc %
40.0 - 48.0	8.0 m	0.10 g/t Au	21.0 g/t Ag	0.07% Zn
66.6 - 70.0	3.4 m	0.21 g/t Au	11.5 g/t Ag	0.21% Zn
94.0 - 118.0	24.0 m	NSV	17.0 g/t Ag	0.12% Zn
132.0 - 142.0	10.0 m	0.28 g/t Au	12.9 g/t Ag	0.08% Zn

DAV-05-03 and DAV-05-04 - DAV-05-03 was drilled to test a geochemical gold-in-soil anomaly with a coincident high resistivity feature, and a northwesterly trending VLF-EM conductor. This hole was abandoned at 52.4 meters, before the target depth was reached, because of difficult drilling conditions. No significant gold and silver values were intersected ("NSV"). Hole DAV-05-04 was a re-drill of Dav-05-03 and was completed to the target depth of 209.4 meters, however no significant gold and silver values were returned.

DAV-05-05 - This hole was drilled to test a gold-in-soil anomaly with a coincident, easterly trending VLF-EM conductor, on the margins of a zone of high chargeability. The hole was completed to 136.25 meters, with several zones of anomalous values of gold and silver:

Depth (m)	Interval (m)	Gold g/t	Silver g/t	Lead %	Zinc %
54.0 - 56.0	2.0 m	0.14 g/t Au	346.0 g/t Ag	1.64% Pb	NSV
124.0 - 126.0	2.0 m	0.53 g/t Au	42.5 g/t Ag	0.94% Pb	0.48% Zn
124.0 - 130.0	6.0 m	0.36 g/t Au	20.7 g/t Ag	0.49% Pb	0.24% Zn

This hole is located 160 metres southeast of any previous drilling in a new target area and the entire hole was significantly anomalous in lead.

The Davidson field program is under the supervision of David Pawliuk, P.Geo. and Robert Weicker, P.Geo., both of whom are qualified persons as defined by National Instrument 43-101.

The Company recently announced the resignation of Mr. Lindsay Bottomer. The Company would like to thank Mr. Bottomer for his years of service to the Company, and for his contribution with the Davidson Property, and wish him well in his future ventures. Mr. Bottomer remains a director of the Company.

Southern Rio is an established Canadian junior exploration company with a focus on silver and gold projects, with nine mineral properties in B.C., Ontario and the Yukon. The Davidson Property, is 100% owned by the Company and located approximately 110 kilometres southwest of Vanderhoof in central British Columbia, and approximately 20 km northeast of the Company's 3Ts project. The recent drill program was the first drill activity on the property since 1994. For Southern Rio property location and information, visit the visit the Company's web site at www.southernrio.com.

=====
New Gold Discovery on Davidson Property
=====

Southern Rio Resources Ltd. (the "Company") is pleased to announce a significant new gold discovery on the recently acquired Davidson Property in central British Columbia.

SW - Nov. 4/05

Hole DAV-05-02 returned the following results:

Depth (m)	Intercept (m)	Gold (g/t)	Silver (g/t)
136.0-150.0	14.0 metres	4.94 g/t Au	17.1 g/t Ag

within a larger mineralized zone of:

Depth (m)	Intercept (m)	Gold (g/t)	Silver (g/t)
96.0-160.0	64.0 metres	1.80 g/t Au	6.5 g/t Ag

The hole was part of an initial five-hole (938.7 metres) drill program carried out in late September-October which tested a number of geophysical and geochemical targets for epithermal gold and silver mineralization on the property. Partial results have been received from the first two holes. Additional assay results, including those from DAV-05-02 below 160 metres depth, and the three later holes will be reported on receipt.

Hole DAV-05-02 was targeted on a coincident NW-SE trending gold-in-soil geochemical anomaly and geophysical conductor. The host rocks are strongly altered felsic volcanics. The 14 metre intersection is comprised of seven samples, each two metres in length; individual values range from a high of 9.81 g/t Au to a low of 2.67 g/t Au. The true width of the intersection is currently unknown. The primary assays were performed by Eco Tech Laboratory in Kamloops, check assays will be submitted to Acme Analytical Laboratories in Vancouver.

Hole DAV-05-02 is located approximately 300 metres northwest of the closest previous drill hole, DAV-92-35, which was drilled by Granges Inc. in 1992. Hole 92-35 returned 4.91 g/t Au and 1.9 g/t Ag over 4.3 metres, from 167.0 to 171.3 m (end of hole) within a wider intercept grading 2.48 g/t Au and 2.3 g/t Ag over 10.3 metres from 161.0 to 171.3 m depth.

The Davidson Property, is 100% owned by the Company and located approximately 110 kilometres southwest of Vanderhoof in central British Columbia, and approximately 20 km northeast of the Company's 3Ts project. The recent drill program was the first drill activity on the property since 1994.

The Company is very pleased with this significant new discovery in a previously untested area of the property. Given the location and size of the mineralized intercept, the Company will undertake an immediate compilation and reinterpretation of the previous geochemical and geophysical data, followed by additional drilling.

The Davidson field program is under the supervision of David Pawliuk,

Subject: _Follow Up: Davidson property Overview

Geoff:

Davidson Property

This is an existing silver-gold property which has been explored several times by different companies. It is located about 160 kilometres south of Vanderhoof (093F 037). In the principle cycle Ganges identified 2 areas of mineralization, the Gold and Silver zones. Previous work was more focused on the lower grade mineralization with bulk mining in mind.

Southern Rio is a junior company exploring on several properties around the province led by Lindsay Bottomer.

The less well defined Gold Zone is the initial target for Southern Rio's work. The Silver zone is about 500 metres northwest of the Gold zone. It is interpreted to be a relatively flat lying body up to 70 metres thick and is open to the northwest. The Silver zone contains an estimated reserve of 6 million tonnes grading 37 grams per tonne silver and 0.05 gram per tonne gold at a shallow depth.

Southern Rio plans to drill approximately 20 holes> These will initially to chase higher grade gold mineralization within the broader Gold zone but will test other targets as well.

Summary

- * Preliminary exploration requiring proving more continuity of high grade mineralization or improving gold values grades of lower grade mineralization.
- * Good target given current gold values and the ability to increase the understanding of the property.
- * Early exploration phase and will require at least a couple of years of successful exploration before we will know if there is a mineral deposit on the property.

Dave

Re: News Release - Wednesday, April 27, 2005
Southern Rio Acquires Blackwater-Davidson Gold-Silver Property
=====

NR: 05-06

Southern Rio Resources Ltd. ("Southern Rio" or the "Company") announces that it has entered into a sale and purchase agreement with West Range Exploration Ltd. ("West Range") whereby the Company may acquire a 100% interest, subject to a 2% net smelter return royalty, in 28 contiguous cell claims totaling approximately 500 hectares covering the former Blackwater-Davidson gold-silver property in central British Columbia.

The property is situated in the Nechako Plateau region approximately 110 kilometres southwest of Vanderhoof, and is accessible by secondary logging roads. Previous work by several parties since the late 1970s includes 31 diamond drillholes and 34 rotary drillholes, which defined a substantial gold-silver system over an area of about 1000 x 700 metres. Of particular interest is high grade structurally controlled gold mineralisation identified in several prior drill holes which may define a zone of higher grade shear hosted-veins. Selected high-grade results from prior drilling include:

Hole DAV-11

Drill Depth (m)	Intercept (m)	Gold	Silver
62.3 - 68.6	6.3	14.28 g/t	26.7 g/t
Including:	3.6	21.71 g/t	34.0 g/t
	1.3	48.3 g/t	19.5 g/t

Hole DAV-9

Drill Depth (m)	Intercept (m)	Gold	Silver
91.41 - 92.93	1.52	16.33 g/t	3.5 g/t

Approximately 500 metres to the northwest of the above gold mineralisation there occurs a separate low-grade silver zone. This zone is interpreted as a shallow, flat-lying body up to 70 metres thick, and remains open in several directions, with average grades in the range of 25 to 40 g/t ~~silver~~.

The Company may acquire the 100% interest for cash payments totaling \$40,000 (CDN) and the issuance of 500,000 shares of the Company. The claims being acquired are contiguous with the surrounding 100% owned Whitewater property recently staked on behalf of the Company. Prior to the acquisition of the Blackwater- Davidson claims, the Company strategically staked the 19 unit (350 hectares) Whitewater property contiguous with the ground acquired from West Range, giving Southern Rio a dominant landholding in this area.

The acquisition of the Blackwater-Davidson property is a significant addition to the Company's portfolio, and in combination with the 3Ts project located approximately 20 kilometres to the southwest, reinforces its primary focus on the exploration for gold-silver deposits in the Nechako region of Central BC.

This agreement is subject to acceptance by the TSX-Venture Exchange.
