

**THE 5,000 HECTARE
MAGENTA PROPERTY IS LOCATED
23 KILOMETRES NORTH OF
CULIACAN, SINOLA, MEXICO.
EXPLORATION IN 2007 WILL FOCUS
ON THREE AREAS**

El Escobal, an historic gold producer, was last mined in 1963 by Minas de San Luis, S.A. (50,000 tonnes grading 30 to 40 grams/tonne (g/t) gold were extracted from five underground drifts on four structures). Measured and indicated underground and open pittable mineral resources are estimated to contain 108,000 ounces of gold. In February 2007 eight core holes are planned to verify previous results and to evaluate gold values on strike to the northwest.

David Dunn and Heather Conley at El Escobal Portal

At **La Prieta**, a 314 meter core hole will be re-entered to test for copper, molybdenum and gold porphyry mineralization at greater depth.

At **El Fierro**, a sample assayed 2.4% nickel, 0.9% cobalt and one g/t gold across 1.5 metres. Current plans are to drill three core holes in the fall of 2007. The Company plans to prospect and map the area in February 2007 to validate a 1974 report describing nickel and platinum values.

**100% OWNED BRANDYWINE
PROPERTY - 92 KILOMETRES
NORTH OF VANCOUVER, B.C.**

Auramex plans to explore two locations in 2007. The first requires rehabilitation of 500 metres of road to regain access to two Silver Tunnel adits for sampling to confirm historic values (seven holes averaging 410.6 g/t silver across 4.45 metres width). At the second target (LR showing) a 2006 sample assayed 60 g/t silver, 2.4 g/t gold, 5.5% zinc and 0.75% copper. A nearby chip sample taken by Placer Dome geologist, Robert Pinsent in 1989, assayed 1900 g/t silver across three metres. Subject to permitting, diamond drilling is planned for the summer of 2007.

**BEAR RIVER AND OTHER
PROPERTIES
NEAR STEWART, B.C.**

More than 30,000 hectares are held under option and thirteen mineralized showings are known on our Stewart properties. During 2006 the Company spent \$190,000 on exploration and further exploration is planned in 2007 to follow up encouraging phase one results. At the Georgie Girl copper discovery, chip samples returned 4.34% copper across a 1.1 metre width along 25 metres length of exposed vein. At Roosevelt Ridge, two samples 500 metres apart on either side of a rapidly ablating icefield in a shale unit, returned 5.5 g/t gold, 3.5% zinc on one side and 7.51 g/t gold, 3.45% zinc on the other. Government mapping shows that the Mt. Dilworth/Salmon River geological contact is projected to pass through the area of the two samples. This is similar mineralogy and geological setting to the Eskay Creek deposit 60 kilometres to the north. At Tide North a pan concentrate stream sediment sample in a small drainage graded 24.2 g/t gold. This property also contains large, essentially unexplored, intense alternation zones similar to American Creek's Electrum property 2 kilometres to the south.

Further information concerning the Company is contained in the Company's public disclosure documents, available on the SEDAR website at www.sedar.com
