CHRISTOPHER JAMES GOLD CORP.

NEWS RELEASE

IMPORTANT MINERALIZED ZONE PURCHASED

October 25, 1999

Trading Symbol: VSE-CJG

Christopher James Gold Corp. has decided to acquire 100% of the highly mineralized polymetallic Brassie Creek claims located near historic Walhachin, BC.

The VSE now has approved the company's request to exercise its option to acquire 100% of the 11 Brassie Creek mineral claims it had (by Agreement made September 5, 1996) under option from Albert Arthur Ablett. As its final payment for the property acquisition, Christopher James will release 50,000 treasury shares to Mr. Ablett.

Reporting to the company's Directors June 3, 1999, Kamloops Geological Services Ltd. consulting geologist Ronald Wells, P. Geo., FGAC recommended a geological mapping-prospecting and diamond drilling program for what he called "*this promising skarn property.*"

Wells' report also advised the company that his June 1999 geological program had "*revealed a very promising skarn environment . . . several new polymetallic skarn showings were discovered . . . the system appears quite extensive, is precious metal enriched, is centred on a greater than 60 metre thick marble unit, is polymetallic (Au, Ag, Cu, Pb, Zn), and is very probably zoned.*"

Kenneth Dawson, Ph.D., P. Geo. and a Director of Christopher James, says that "*Wells' geological program has identified a 2 to 3 square kilometre area which has potential for economic skarn ore bodies. This property acquisition, along with other extensive claim holdings in the area, will allow our company to undertake a systematic process of exploration and development, in a highly promising environment. We are confident the Brassie Creek property will attract considerable interest, especially given recent improvements in metal prices.*"

Diamond drill results from the Brassie Creek property will be available once all aspects of the 1999 fall exploration program are complete and compiled in a report. The fall program objective at Brassie Creek is to investigate the extent of mineralization and obtain greater understanding of the property's geological environment.

Previously reported information from the Brassie Creek property disclosed zinc values ranging from 1.58% up to 19.80%. One 13.99 metre polymetallic interval disclosed gold averaging .23 g/t; silver averaging 7.25 g/t; copper averaging .24%, and zinc at 1.90%.

Christopher James Gold Corp. is a well managed mining exploration company headquartered at Kamloops, BC and trading on the VSE under the CJG symbol. The company's portfolio of highly promising gold/copper and polymetallic (Au, Ag, Zn, Cu, Pb) properties are well positioned to take advantage of the strengthening current market for gold, silver, zinc, and copper.
