Mtn
(Hughes 1/4)
(Aug 93)

* **Cornice Mountain** drill project of Trev Corp/Cameco in Bear Pass east of Stewart was examined with Mary Lou Malott on Aug 13. Our guides were David Kennedy and Andrew Wilkins. There are gossans, skarn and vein showings north and south of the highway but the 1993 drill target is a pyrite-sphalerite breccia zone with gold values near the top of Cornice Mountain. Geologist-climbers have also located a chalcopyrite zone higher in the cliffs that is believed to be controlled by the same structure. Several fracture trends are apparent and control and attitude of mineralization is not understood. Two drill holes from an icefield below the sphalerite breccia have been completed without intersecting the zone.
