### DRILLING TO COMMENCE ON GOLD STAR PROPERTY

Brican Resources Ltd. is pleased to announce that the initial program of diamond drilling has begun on the GOLD STAR property near Vernon, B. C. A minimum of 2000 feet of drilling will test three targets for epithermal gold mineralization.

The GOLD STAR is adjacent to the Brett claims of Huntington Resources Ltd. where high-grade gold values have been encountered in an ongoing drill program on a mineralized zone a short distance east of Brican's property boundary (see map on reverse).

The mineralization is of two types: Gold values are associated with quartz veining in steep shear zones cutting tertiary volcanic rock, and gold mineralization also occurs in disseminated zones in porous horizons of flat-lying volcanic tuff adjacent to the shear zones. This latter type of mineralization offers potential for relatively larger tonnages.

On the GOLD STAR property, three shear zones have been delineated by geophysical surveys. Detailed geochemical soil surveys have discovered anomalous gold zones on each shear zone where it cuts the porous tuff horizon.

The first five drill holes are planned to test these three target areas. On the western part of the property, the Sunday Zone will be tested with two holes, as will the Border Zone on the eastern boundary. A newly discovered target, the Central Zone, will be tested with one hole.

Gary Logan, B.Sc.,  
President  
Brican Resources Ltd.
