#### News Release

Diamond Drilling Programs Completed on Eagle Plains' Findlay Creek Area Base-Metal Properties, Southeastern B.C.

Cranbrook, B.C. 07 September, 2000: Eagle Plains Resources Ltd. (EPL:CDNX) announces that it has received notification from optionees Rio Algom Exploration Inc. and Kennecott Canada Exploration Inc. that exploration activities for the 2000 field season have been completed on Eagle Plains' 100% owned South Findlay and Greenland Creek properties, located near Kimberley, British Columbia.

Rio Algom drilled 2,578 m (8,456') in three holes on the South Findlay property. The holes targeted the Lower Aldridge-Middle Aldridge contact (LMC) delineated by 1999 geological mapping. Each hole collared in Middle Aldridge stratigraphy and was positioned to test the LMC contact approximately one kilometre down dip from its surface exposure. All three holes intersected the LMC contact and terminated in Lower Aldridge stratigraphy. Sampling and analysis of the core revealed weakly anomalous zinc and lead values in laminated greywackes immediately beneath the LMC contact.

Rio Algom has since served notice to Eagle Plains that they are terminating their option on the property.

On the Greenland Creek property, Kennecott drilled a single 295m (968') hole which was to test a prominent zinc in soil geochemical anomaly delineated during the 1999 field season. The hole intersected a thick gabbro sill from 90m to 209m, then at 228m the hole entered granitic pegmatite that persisted to the bottom of the hole.

On behalf of the Board of Directors

- Supergroup Holdings (Dave Pighin et al) has staked the entire Pc Hellroaring Creek Stock south of St.Mary Lake (NTS 082F/9E) after all pre-existing tenure had lapsed. The stock is well known for its exotic pegmatites and has previously been explored for its beryl, feldspar, mica, and lithium potential. With the Aldridge/Sullivan play starting to slip under the waves, Dave and his partners have researched and become enthused about the present and future markets for beryllium, rubidium, REE's, and other industrial commodities present in the pegmatites. Since staking, Craig Kennedy and his sons have located some previously unreported additional exposures of very coarse beryl crystals (I was shown an euhedral crystal at their core shack which is 16" long and about 5" in diameter). The new claims adjoin the east side of their PAKK property, which is currently under option to Chapleau Resources with Sullivan-style sedex as the target, and are subject to a perimeter clause in the Chapleau agreement. Therefore, Chapleau automatically becomes the operator and has now submitted an NoW to our office for a diamond drilling program consisting of a total 6800m in 68 holes, 4 at each of 17 sites. Work is planned to begin in early September.

- Meanwhile, in the Sinclair Creek and Upper Jack areas of the **PAKK** property, Chapleau is currently drilling two holes to test the Sullivan horizon downdip from surface indications of stratiform zinc mineralization and heavy vent alteration discovered in 1999. The first hole is actually a deepening of an old Cominco hole which is now believed to have stopped short of Sullivan time.

50 LUV AN- Cominco's recent release of second-quarter results mentioned, without comment, that the Sullivan mine is now projected to close in December 2001. Dennis Merber confirmed that the company has changed its projection from the June 2002 date given in the last annual report back to the end-of-2001 date, and "it could very likely change again".

 $\mathcal{H}_{\rho \mathcal{K}}^{\mathcal{H}}$  - In the Matthew Creek area west of Sullivan, Rio Algom is <u>part way through its second deep hole testing</u> the LMC (Sullivan horizon) on the **Pyramid Creek** property optioned from Abitibi Mines Ltd. From there it will move to the adjoining **Bootleg** property optioned from Eagle Plains Resources Ltd. These are basically stratigraphic holes and details of the results will have to await press releases from the property owners.

 $\vec{f} \mid \vec{N} \mid \vec{D} \mid \vec{M} \mid \vec{D} \mid \vec{M} \mid \vec{N} \mid \vec{D} \mid \vec{M} \mid \vec{N} \mid \vec{D} \mid \vec{M} \mid \vec{D} \mid \vec{M} \mid \vec{N} \mid \vec{D} \mid \vec{M} \mid$ 

In the bad news category, is the fact that Kennecott aborted its first drill hole well short of target depth on the **Greenland Greek** property in the Findlay block, withdrew immediately from the property, and now makes no secret locally of the fact that it will not be doing any more work there. Its resident geologist in Invermere, Steve Coombes, is now working in the Yukon. The property owner, Eagle Plains, has not made any official statement about the program or the status of its option agreement, and until it does, this should be considered somewhat CONFIDENTIAL, but the outlook for the Findlay block, last year's "hot spot", looks bleak unless Rio Algom remains positive.

#### News Release

Drilling Commences on Eagle Plains' Greenland Creek Property, Southeastern British Columbia

Cranbrook, BC; 28 June, 2000: Eagle Plains Resources Ltd. (EPL/CDNX) is pleased to announce that it has received notification from optionee Kennecott Canada Exploration Inc. that diamond drilling has commenced on Eagle Plains' 100% owned Greenland Creek property, located 30km northwest of Kimberley, British Columbia.

Work completed by Kennecott on the property in 1999 consisted of 1:10,000 scale geological mapping in conjunction with a broad geochemical survey consisting of 1,371 soil samples, 72 selected rock samples, and 45 stream-sediment samples. The program resulted in the delineation of a prominent 3km x 1km soil geochemical anomaly hosting elevated zinc values with associated elements including beryllium, bismuth, and cadmium. The anomaly overlies Proterozoic Aldridge Formation sedimentary rocks, and is considered a significant exploration target. Kennecott intends to test the soil anomaly area with a 2000 foot (600m) diamond-drilling program.

The area is considered highly prospective for the discovery of new zinc sedex deposits located within the Proterozoic Aldridge Formation. The Sullivan deposit, located near Kimberley, is hosted by the same group of rocks and contained reserves of 149,000,000 tonnes grading 6.3% lead, 5.9% zinc, and 69 g/T silver. The mine has seen continuous production for over 100 years and is scheduled for shut-down in December, 2001.

Kennecott may earn a 60% interest in the 247 unit (15,000 acre) property by spending \$2,000,000 on exploration and making total cash payments of \$310,000 to Eagle Plains over a four year period, with Kennecott as the project operator. The claims are bounded to the north by Eagle Plains' 271unit (16,460 acre) South Findlay property, currently under option to Rio Algom Exploration Ltd., which is now underway on a 2000m, three-hole drilling program (see May 29th, 2000 news release).

# <u>1999 Program Completed on Eagle Plains' Greenland Creek Property,</u> <u>southeastern British Columbia</u>

Cranbrook, BC; 19 November, 1999: Eagle Plains Resources Ltd. (EPL/ASE) is pleased to announce that it has received notification from optionee Kennecott Canada Exploration Inc. ("Kennecott") that it has successfully completed a \$240,000 first phase exploration program on Eagle Plains' 100% owned Greenland Creek property, located 30km northwest of Kimberley, B.C.. Kennecott may earn a 60% interest in the 247 unit (15,000 acre) property by spending \$2,000,000 on exploration and making total cash payments of \$310,000 to Eagle Plains over a four year period, with Kennecott as the project operator. A cash payment of \$70,000 was made upon signing of a formal option agreement (see November 15, 1998 news release). The claims are bounded to the north by Eagle Plains' 271unit (16,460 acre) South Findlay property, currently under option to Rio Algom Exploration Ltd. (see November 16, 1999 news release). The Sullivan deposit, located near Kimberley, is hosted by the same sequence of rocks as those present at Greenland Creek, and contained reserves of 149,000,000 tonnes grading 6.3% lead, 5.9% zinc, and 69 g/T silver. The mine has seen continuous production for over 100 years and is scheduled for shut-down in December, 2001.

Work completed by Kennecott in 1999 consisted of 1:10,000 scale geological mapping over most of the property area, in conjunction with a broad geochemical survey consisting of 1,371 soil samples, 72 selected rock samples, and 45 stream-sediment samples. The program resulted in the delineation of a 3km x 1km soil geochemical anomaly hosting zinc values in excess of 700ppm, with associated elements including beryllium, bismuth, and cadmium. The anomaly overlies Proterozoic Aldridge Formation sedimentary rocks, and is considered a significant exploration target. Kennecott has indicated that it will test the anomaly area by diamond drilling during the upcoming field season.

In order to maintain its option on the property, Kennecott must make a further cash payment to Eagle Plains of \$60,000 by January 4<sup>th</sup>, 2000, and complete total exploration expenditures of \$400,000 by December 31<sup>st</sup>, 2000.

# Miner River/Eagle Plains Sign Agreement to Increase Kennecott Activity in North Sullivan Camp

November 15, 1998

Cranbrook, BC: Miner River Resources Ltd. (MRG:ASE) and Eagle Plains Resources Ltd. (EPL:ASE) have signed a letter of agreement with Kennecott Canada Exploration Inc. on their 50:50 joint-venture Greenland Creek property located 30 kilometres north of Cominco's Sullivan base metal mine at Kimberley, B. C. The agreement provides that Kennecott may earn a 60% interest in the 247 unit (15,000 acre) property by spending \$2,000,000 on exploration and making total cash payments of \$310,000 to Miner River and Eagle Plains over a 4 year period, with Kennecott as the project operator. A cash payment of \$70,000 will be made to Miner River and Eagle Plains upon signing of a formal option agreement.

The companies carried out a 7-hole diamond-drill program totaling 1893 feet (577 metres) on the Greenland Creek property late in 1997 with encouraging results. All seven holes encountered base metal mineralization and alteration assemblages associated with "sedex" deposits (see News Release January 21, 1998).

The Greenland Creek property adjoins the 425 unit (25,000 acre) Findlay Creek property to the north which Kennecott currently has under option from Miner River/Eagle Plains. Kennecott has made over \$1,000,000 in exploration expenditures to date on the Findlay property (see News Release November 3, 1998). Together the Greenland Creek and Findlay Creek properties comprise 672 claim units (40,000 acres) within the North Sullivan Camp. The essence of the two option agreements is that Kennecott has the right to earn a 60% interest in the combined properties by completing \$4,000,000 in exploration expenditures and making total cash payments of \$560,000 to Miner River and Eagle Plains by December 31, 2002.

Miner River and Eagle Plains are related companies with seasoned management and aggressive exploration strategies. They are 50:50 joint venture partners in 20 gold and base metal properties in various stages of exploration in British Columbia and the Yukon Territory.
