BROOKS RESOURCES LTD.

NEWS RELEASE

LOG NO:	OCT 11 1989	VAN	4
ACTION:			
FILE NO:	KELLIN (new)		

October 5, 1989

Brooks Resources Ltd. is pleased to announce that John Schussler of D.J. Drilling Company Ltd. has been engaged to drill a minimum of 3,000 feet on the company's 100% owned Kellin property.

The property consist of 181 units and is located 50 km southeast of Quesnel B.C. and is situated in the Quesnel Trough, a geologically defined belt which hosts several major base and precious metal mines and deposits.

In May of 1989 Brooks Resources completed a \$60,000 exploration program that included a geological survey that confirmed a 2 km long VLF and Magnetometer anomaly. This and other geophysical conductors were tested by a series of about 140 deep trenches. These contained highly anomalous silver, zinc, lead and molybdenum with lessor but anomalous gold located in a 600 by 600 foot area. The mineralization identified was chalcopyrite, pyrite and pyrrhotite in a zone of highly oxidized quartz carbonate alteration near an intrusive body. The Kellin property has a geological setting similar to QPX/Placer Dome's QR gold deposit and Imperial Metals/Corona's Mt. Polley copper gold deposit both located on strike to the southeast.

The QR gold deposit is 5 km southeast of the Kellin property and contains 814,000 tons of 0.13 oz/ton gold that is surface mineable. An additional 152,000 tons of 0.26 oz/ton gold can be accessed by an underground decline. The QR deposit is in the final feasibility and environmental study stage. The proposed 450-ton per day mine and mill is estimated to cost \$10,000,000 and is expected to be profitable at today's gold prices.

The Quesnel Trough geological environment also hosts the Mt. Polley copper gold deposit which is located 15 km southeast of Kellin. This deposit has mineable reserves of 53,000,000 tons of .44% copper and .017 oz/ton gold. A 15,000 ton per day mill is estimated to cost \$135,000,000. Imperial Metals and Corona Corp. expect a production decision by mid 1990.

The Kellin claims also host geology similar to other copper, gold, molybdenum deposits such as Continental Gold's Mount Milligan project, some distance north, and Placer Dome's Gibraltar Mine, about 40 km to the south.

The company is fully funded for this program and expects drilling to commence mid October and to be completed by late November.
