**Canadian Gold Hunter Expands Copper-Gold Donnelly Zone at GJ Project**

**August 10, 2005 (CGH -- TSX) ... Canadian Gold Hunter Corp.** (the "Company") is pleased to provide an update on the current diamond drilling program on the GJ/Kinaskan copper-gold project in northern British Columbia.

The Company has received assay results for the first thirteen holes of a planned 50 hole, 15,000-metre diamond drill program. Holes 05-023, 025, 026, 028 and 030 tested the eastern extension of the Donnelly Zone and have extended the zone 300 metres to the east. The rest of the holes are infill holes within previously drilled portions of the Donnelly Zone. Please see attached drill results table.

Copper-gold mineralization has now been traced for over a 1400-metre strike length on the Donnelly Zone from hole 04-015 in the west to hole 05-030 in the east. The zone dips steeply to the south, strikes east-west and is up to 300 metres thick. The holes are generally drilled at minus 45 degrees to the north in order to cut across the zone. Please see attached map and cross sections. The results to date are meeting expectations, for the most part returning long intervals with grades consistent with those from previous drilling.

A key objective of the program is to expand the known inferred resource at the Donnelly Zone and bring much of it into the indicated category. Further potential also exists on strike and down dip on the North and GJ Zones. An independent resource estimate was commissioned following the 2004 program. This estimate will be updated upon completion of the current 2005 program. 2004 Donnelly Inferred Resource Estimate

2004 Donnelly Inferred Resource Estimate

Cut off Cu (%)	Tonnes (000,000)	Cu (%)	Au (g/t)	Contained Cu (million lbs)	Contained Au (million ozs)
0.10	105.1	0.32	0.32	741	1.1
0.20(i)	71.2	0.40	0.40	628	0.9
0.30	41.5	0.50	0.52	457	0.7
0.40	24.5	0.61	0.66	329	0.5

\*base case

Rick Bailes, President of CGH, commented, "The drilling at the Donnelly Zone has been very encouraging and the zone is still open on strike and to depth. Two rigs are currently on the property and we plan to test the western portion of the zone next and then move the drills to other targets on the property while we compile the Donnelly results." The GJ/Kinaskan gold/copper property consists of a large claim group covering several significant porphyry copper-gold systems as well as a number of high-grade gold vein

occurrences.

The focus of the 2005 drilling is porphyry style copper-gold mineralization associated with the Groat stock, a poorly exposed elongated stock of monzodiorite, which intrudes andesite and volcanoclastic sediments. Three mineralized zones have been discovered to date associated with the Groat stock: the Donnelly Zone, the GJ Zone and the North Zone. Significant gold-rich porphyry deposits that occur in the region are Red Chris: 446.1 million tonnes grading 0.36% copper and 0.29 g/t gold, and Galore Creek; 286 million tonnes grading 0.73% copper and 0.44g/t gold. CGH is engaged in gold exploration focused on Canadian projects. The Company will be drilling its Manson Creek gold project in central B.C. in the fall of 2005. The Company has a 100% interest in the GJ/Kinaskan project. RCM

*The 2004 resource estimate was based on 23 drill holes and all material is considered at this time to be in the inferred resource category. The 0.20% copper cut-off grade has been chosen as the "base case" scenario based on Red Chris (bcMetals Corporation), the nearest analogy to the deposit. Material below this cut-off has questionable economic expectation at this point, but at least some of it, if mined as a consequence of gaining access to the higher grade material, might well be segregated in a lowgrade stockpile in case of exceptional metal prices. A 43-101 technical report by David T. Mehner, M.Sc., P.Geo. and Giles R. Peatfield, Ph.D., P.Eng., dated May 15, 2005, is available on Sedar ([www.sedar.com](http://www.sedar.com)) as well as the Company's website ([www.canadiangoldhunter.com](http://www.canadiangoldhunter.com)).*

*The Donnelly Zone resource estimate was carried out by qualified person, Dr. Giles Peatfield, Ph.D., P.Eng. using a manual sectional method. The geological model was based on 5,256 metres of diamond drilling in 23 core holes with some 1,500 assays. Thirteen of the core holes were drilled by Texasgulf Canada Ltd. ("Tg") in 1977 and 1980; this drilling was supervised by Dr. Peatfield. The other ten holes were drilled by the Company in 2004, in a program supervised by Mr. Mehner. The assay results from the 2004 diamond drill program were consistent with, and corroborated, the earlier work by Tg.*

*The 2005 drill program and sampling protocol are being supervised by qualified person David Mehner, P.Geo., Project Geologist for Canadian Gold Hunter. Appropriate quality control and quality assurance protocols are utilized on the program. Standard reference samples are inserted in each batch of assays. The Canadian Gold Hunter drill samples are analyzed for gold by fire assay and for copper and silver by "ICP" at ALS Chemex in North Vancouver, B. C., Canada. Drill core samples are prepared and analyzed by ALS Chemex in accordance with industry standards. Drill results and technical data are reviewed by Dr. Giles Peatfield, P.Eng., a Qualified Person pursuant to NI 43-101, prior to release. Dr. Peatfield is independent of the Company. True thicknesses are not accurately known at this time; in some cases they may be less than the core lengths reported.*

ON BEHALF OF THE BOARD

Richard J. Bailes  
President

**Canadian Gold Hunter Announces Additional Significant Copper-Gold Intercepts in The Donnelly Zone, GJ Project**

**September 22, 2004 (CGH - TSX) ... Canadian Gold Hunter Corp.**  
 ("CGH" or the "Company") is pleased to provide the final drill results from the 4,267-metre summer diamond drilling program on the 100% owned GJ/Kinaskan bulk-tonnage copper-gold project in northern British Columbia. Please see the attached map and sections.

Copper-gold mineralization has been traced for over an 1100-metre strike length on the Donnelly Zone from Hole 04-015 in the west to Hole 04-20 in the east. The holes reported herein are 200 to 300-metre step outs. The mineralization at the Donnelly Zone is open along strike, at depth and to the north.

\* Previously announced

The Donnelly Zone dips steeply to the south at about 60 to 70 degrees. It is at least 200 metres wide on section 9800 E, its easternmost section. The

zone is open for expansion to the east and north in this area where it has not been drilled. The Donnelly Zone is about 300 meters wide on sections 9600E and 9400E; however, on the westernmost sections, 9200E to 8700E the Donnelly Zone splits into two separate zones, both about 50 to 100 metres wide, referred to as the Donnelly North and South Zones (see map Holes 04-15 and 016 tested the Donnelly North Zone down dip from historical Texasgulf holes 77-01 to 03. Hole 04-17 tested the near surface extension the Donnelly South Zone.

Rick Bailes, President of CGH, commented, "This is a big step forward for the GJ property in that we have outlined a continuous, strongly mineralized system for over one kilometre. There is ample room to expand this zone on strike, to depth and to the north. In addition, we have identified several other mineralized zones on the property that have excellent copper-gold potential."

The GJ/Kinaskan gold/copper property consists of a large claim group covering several significant porphyry copper-gold systems as well as a number of high-grade gold vein systems.

The focus of the summer drilling was the Groat porphyry where copper-gold mineralization is associated with a poorly exposed elongated stock of monzodiorite, which intrudes andesite and volcanoclastic sediments. Three mineralized zones have been discovered that are associated with the Groat porphyry: the Donnelly Zone, the GJ Zone and the North Zone. Significant gold-rich porphyry deposits that occur in the same general area are Red Chris; 236 million tonnes grading 0.46% copper and 0.37g/t gold, and Galore Creek; 284 million tonnes grading 0.67% copper and 0.35g/t gold.

Drilling will resume in the spring, 2005.

Drill core was prepared and analyzed by ALS Chemex in accordance with industry standards. Drill results and technical data were reviewed by R. J. Bailes, P. Geo., a Qualified Person pursuant to NI 43-101.

CGH is engaged in gold exploration focused on its Canadian projects. The current drill program is one of five diamond drill programs planned over the summer and fall of 2004. Drilling has been completed at the Noomut gold project in Nunavut and assays are pending. Drilling is ongoing at the Assean Lake gold project in Manitoba and will commence in the early fall on the Manson Creek and Bob Creek gold projects in B.C.

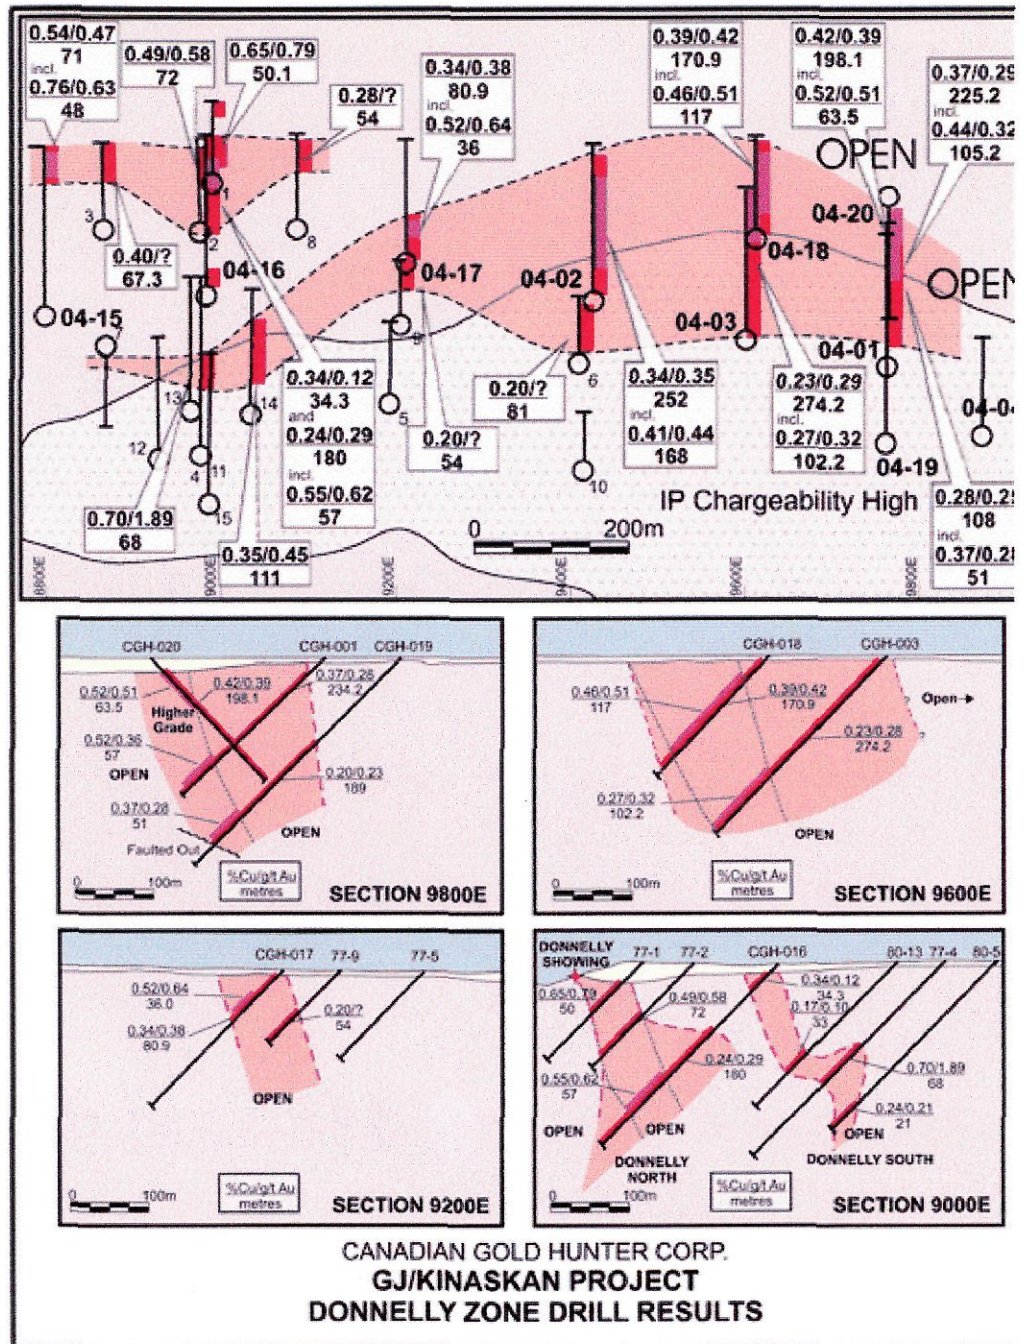

ON BEHALF OF THE BOARD

Richard J. Bailes  
President

# CANADIAN GOLD HUNTER CORP.

CGH is a gold exploration company with its focus in Canada. The company has been actively exploring the GJ/Kinaskan, Manson Creek, Assean Lake, MacVicar Lake and Bob Creek projects.

The 56 hole, 2005 GJ/Kinaskan drill program totalled 16,394m. Copper-gold mineralisation has now been traced over a 1500m strike length on the Donnelly Zone. The zone dips steeply to the south, strikes east-west and is up to 300m thick in the central area. Hole 05-067, which intersected 249.7m grading 0.30% copper and 0.50g/t gold is typical of this area. Hole 05-076, the last hole of this year's program intersected the highest grade interval of the program, 46.95m grading 0.83% copper and 1.32g/t gold within a thicker interval that graded 0.44% copper and 0.65g/t gold over 130.95m. Hole 05-076 is on the most westerly fence of holes drilled on the Donnelly Zone. Other high grade holes at the west end of the zone include hole 05-042, which intersected 51.82m grading 0.85% copper and 0.73g/t gold and hole 04-015, which intersected 48.00m of 0.76% copper and 0.63g/t gold.

Drilling was also undertaken at Manson Creek and Assean Lake in 2005.
