MARIPOSITE [MI 94D 137 (Johan) and 94D 136 (Glacier)]

On August 18th Paul Wojdak and I flew over the "Mariposite" property. Hemlo Gold has been conducting surface work this year and is 'excited' about the property's gold potential. A 3km by 1km area of anomalous gold geochemistry has been outlined; there has been no drilling. The gold appears to be associated with ankeritic-rich zones in altered Takla Group volcanic rocks, related to dioritic (+ magnetite) intrusions. The Glacier stockwork zone was also sampled by Hemlo.
