

INFORMATION FOR B.C. MINERAL EXPLORATION REVIEW 1994

VOJ - McConnell CK.

PROPERTY NAME: McCONNELL CREEK

NAME OF OWNER(S): Hemlo Gold Mines Inc. 885319

NAME OF OPERATOR(S): As Above.

PROGRAM STILL IN PROGRESS? No.

EXPLORATION PROGRAM BUDGET: 1994:

CONFIDENTIAL: CAN BE RELEASED:

(If confidential will be used only as a portion of the overall NWBC total)

WORK DONE: (In particular, number of drill holes and total meterage; meters of U/G development; geophysical, geochemical, geological surveys)

Prospecting: 17 silts, 9 pancons. GEOCHEMICAL: 47 rocks, 71 silts,

COMMODITIES: (eg. Au, Ag) Au-Cu.

POSTULATED DEPOSIT TYPE: SKARN.

COMMENTS (Significant results, zones tested, short geological description):

Prospecting & sampling was conducted in an area underlain by a north west trending volcanic (Takla) / diorite contact zone in close proximity to calcareous sediment in an area of anomalous Au from historic pancons. Alteration of the volcanic package to the NW of the contact zone exists as pervasive, sheared & veined Kspar grading to propylitic toward the SE. Mineralization observed along the sediment package was in the form of silica, epidote, chlorite & local malachite. No significant results were returned from the '94 programme.

COMPLETED BY: D-G-6/LL PHONE # 684 9246

NOTE: Any additional information concerning the geology of your property would be appreciated.
