FOR RELEASE: September 30, 1987

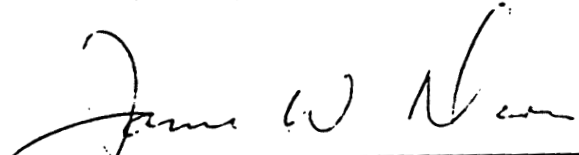

The initial 3000' diamond drilling program on Prolific's Motase Lake property has been completed and all assay results are now available. A total of ten holes were drilled to test gold mineralization in the Huestis Zone which is one of the three zones identified on the property to date. The objectives of this program were to gain an understanding of the width, grade, and geometry of the gold zone. Significant results obtained during this program are as follows:

Hole	Intersection	Width	Gold oz/ton	Silver oz/ton
DDH 87-1	310.0-313.0'	3.0'	0.26	0.09
DDH 87-3	45.9- 56.0'	10.1'	0.24	0.36
	including 45.9- 47.8	1.9'	1.16	1.65
DDH 87-4	44.5- 45.3'	0.8'	0.17	6.83
	130.3-134.2'	3.9'	0.26	0.70
DDH-87-5	258.0-259.0'	1.0'	0.15	2.68
DDH 87-9	19.0- 21.5'	2.5'	0.13	0.47
DDH 87-10	68.0- 86.0'	18.0'	0.25	0.42
	including 81.0- 83.4'	2.4'	1.72	1.34
	138.5-141.0'	2.5'	0.10	1.55

These results have provided sufficient geological data to establish the geometry and distribution of precious metals within this zone.

Additional drilling will be required to further evaluate the Huestis Zone and the two remaining zones on the property.

Additional surface work carried out this summer has extended the Huestis Zone 200 m further east from the original discovery area. Seven rock samples ranging in grade from 0.113 to 2 oz/ton gold have been collected along this trend.
