NEWS RELEASE

**SIGNIFICANT INTERCEPTS: 760 FEET OF 0.20% Cu equiv. DDH 93-3 and...
140 FEET OF 0.34% Cu equiv. DDH 93-2.**

Hera Resources Inc. (the company) announces that it has completed 3000 feet of diamond drilling on it's Rey Lake Property.

Diamond Drill Hole 93-3 encountered 12.6 feet of overburden and was drilled to a total depth of 775 feet. The hole encountered mineralized volcanic rock throughout its entire length. Average values for the complete hole (762.4 feet) was 0.17% Cu and 0.03% Mo or copper equivalent of 0.20%. Mineralization continues to depth.

The highest values were found in DDH 93-2, collared 75 meters east of hole 1, in a 140 ft. section (between 7 feet and 142 feet) grading 0.30% Cu and 0.0154% Mo. or copper equivalent of 0.34%.

DDH 93-1 encountered well pyritized rock with lower copper values and is believed to be on the north edge of the system. DDH 93-3 stepped 400 meters south.

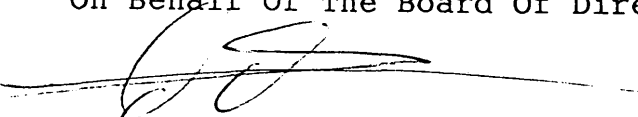

DDH 93-4 was collared on section, 200 meters to the west of DDH 93-3 and encountered similar mineralized volcanic rock; results are pending.

The Company's recently completed IP program indicated high to moderate chargeability over an area 1100 meters by 800 meters and open to the north and south. Most of this area lies to the west of the area of previous drilling and remains to be tested.

The company is highly encouraged by the program to date and considers the results consistent with it's model of a major buried porphyry on its Rey Lake property.

The drill program continues.

On Behalf Of The Board Of Directors

David Hjerpe, President
