Dec. 6/99

DOT COM

- just before Horsefly - turn left (North)
- chat with Rob Cameron (Phelps Dodge)
- slabs of analcite bslt (float)
with disseminated barnite + chalcocite ± native
(Cu ± digenite?)
- Underlying ^{alkalic} porphyry system - hydrothermal
mineralized fluids 'escaped' up into
co-eval alkalic volcs
(eg. analogy - Galore (k?))

DOT COM

Sept. 27/02

- chat (lunch) ^(BEA) with Rob Cameron (Phelps Dodge)

→ RC visited earlier in week with owner Herb Allen

- RC "likes" property - looks like Sustut
ie. fin. gr. diss. sm. chalcocite + bornite ± native Cu
in basalt → eq. 3 to 4% Cu + 100pt Ag
(apparently lots of other showings up +
down (N-S), but many not recognized
as volcanic redbed type

(because malachite stain in interbedded limestone
~~is~~ only 'notice' / clue).

[Squingula R. area - Red (ex-can. Sup.) prop.?
103

RIM (Dotcom)

- chat with Rob Cameron

Feb. 2 more add - Phelps Page

IP anomaly

→ top 8m . 6% Cu 1 opt Ag
- very limited step.

(Note: Craig Payne tipped TOS off)

TOS → relayed to Rob Lane
