## HIGH GRADE GOLD OUTLINED

The company is pleased to announce that Andris Kikauka, geologist, has received the results of soil and rock sampling on the 100% owned, 1440 acre ROX GOLD CLAIM group, which is located 23.5 miles northeast of Powell River, B.C.

Significant results of detailed surface sampling of the No Man's Creek gold, Quartz, sulphide vein are reported. **The structure outcrops intermittently in five cross-cutting creek beds over a total distance of 1560 feet.** Detailed sampling in two of these exposures, designated as 1+50 N creek and as 1+00 N creek, gave the following results:

1+50 N Creek averaged 0.401 opt gold along a strike length of 23 feet at an average width of 4 feet.

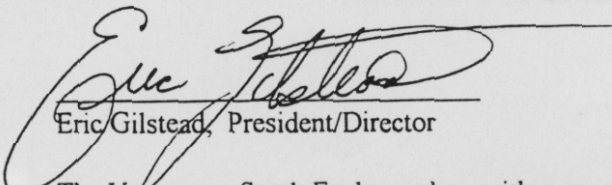

1+00 N Creek averaged 0.736 opt gold along a strike length of 32.8 feet at an average width of 4 feet.

**Individual high grade samples ranged from 1.567 to a high of 7.268 opt**

The two zones sampled are separated by 150 feet along the projected strike of the structure which implies a possible continuity of grade at least 206 feet of the total 1560 foot structure. The mineralization is characterized by an high grade core of quartz containing gold, silver, pyrite, copper and zinc. The high grade core is flanked by a zone of clay gouge, silicification and fracture filled sulphide mineralization that ranges up to 6.5 feet in width. The structure is steeply to vertical dipping and should persist to significant depths.

Similar narrow high-grade gold deposits have previously been successfully mined elsewhere in British Columbia, such as at the Zeballos Camp.

Mr. Kikauka has recommended a program of trenching and 3000 feet of diamond drilling costing an estimated \$150,000.00 to be carried out in early 1996.

**HIGH GRADE "GOLD"**  
**PROPERTY ACQUISITION**

November 28, 1995

Navarre Resource Corp. is pleased to announce the acquisition of the 1440 acre ROX 1-5 claim group located in the Mount Diadem Area near Jervis Inlet approximately 23.5 miles northeast of Powell River, B.C.

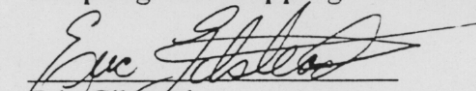

Work by White Channel Resources Inc. in 1991 traced a network of parallel quartz veins located 0.8 km. east of the massive sulphide zone over a distance of 1550 feet. **Visible free gold** is present in quartz gangue with sparse chalcopyrite, sphalerite, pyrite, and/or pyrrhotite. Highlights of hand trenching performed along 5 creekbed exposures along the strike length of the veins are summarized below:

Sample No.	Gold Oz/Ton	Width in Feet
1	0.34	3.1
2	0.53	1.2
3	1.01	3.2

Sample No.	Gold Oz/Ton	Width in Feet
4	2.77	9.1
5	0.29	2.6
6	0.28	1.3

The wighted average of the above samples is 1.52 oz/ton Gold over the total trench length of 20' 6"

Management of Navarre Res. Corp. feels the gold bearing quartz vein network has potential to host 100,000 ounces of gold and is currently exploring the property. **A program of trenching, sampling and mapping is now underway, to be followed by a diamond drill program.**
