

**REVIEW OF THE CORE MINERAL PROPERTY ASSETS OF THE COMPANY**

The acquisition of mineral properties owned by Falconbridge Limited in British Columbia has provided Doublestar Resources with an outstanding portfolio of advanced base metal projects which will be the focus of the company's planned exploration programs in 2000 and beyond.

**SUSTUT PROJECT**

The Sustut copper deposit was discovered and outlined by Falconbridge Limited between 1971 and 1974. A total of 17,195 m of drilling in 139 holes has defined a mineral inventory of 43.545 million tonnes grading 0.81% copper at a cut-off grade of 0.40% Cu. (Wrigglesworth, 1974). Falconbridge calculated an in-house undiluted open pit "reserve" of 21.143 million tonnes grading 1.17% Cu. at a cut-off grade of 0.40% Cu. (Munroe, 1973). Within this, Munroe identified a "starter pit" containing 7.532 million tonnes grading 1.64% Cu. Doublestar will focus on the further definition of this high grade zone by conducting in-fill drilling, which will be required to advance the mineral inventory toward a reserve. A drill section of the North Zone is shown below to illustrate the tabular nature of the mineralization, as well as the low stripping ratio for open pit mining.
