Subject: British Columbia Ag, Au, Cu prospect for sale/option

GeoQwest Excursions Ltd. changed it's focus last year away from tourism and BC Mining Heritage Tours and now focuses on Canadian and international mineral exploration.

As part of that focus, GeoQwest has re-staked the former Tri claims of Cominco Ltd that were prospected and sampled in 1988 to 1990 and has it available for sale or option.

These claims are located 70 kms west of Telegraph Creek in northwest BC. The property hosts areas of untested Ag, Au, Cu and base metal grab and soil in 3 separate distinct mineral settings. Rock grab samples that returned 4.6 and 9.1 grams per tonne Au, 179.4 grams per tonne Ag, 0.34% Cu, 2.3% Pb and 6.9% Zn in altered Qtz Ca vein breccia zone.

The area is underlain with a thick sequence of Middle (?) and Upper Triassic fine-grained sediments and minor intercalated volcanic rocks consisting of andesites, greenstone and pillowed basalt. Lenses of impure limestone and calcareous shale occur at several stratigraphic levels.

The original property was staked on a regional multi element government geological survey. It had no prior showing history. It has also not seen any work beyond mapping and surface geochemistry done in 1990.

This property is available for sale or option for this field season.
