

# WATSON BAR

Sept. 30/97

- tel. talk with Dave Lefebvre
- 1-wk Field Trip: Carlin - Watson Bar - Bralorne

→ In core from Zone T (above Zone 5),  
 - identified fr.-dissem. arsenopyrite + pyrite,  
 plus 1m vein of arsenopyrite in  
intrusive rock

Implications? — a) same as sill/dyke above  
 Zone 5 Trench?

b) similar setting/target at MAD  
 prop along strike to NW (First Point Mtn.)  
 i.e. intrusion-related gold?

c) à la Poison Mtn. - peripheral gold zone

MAD (Utah) 920/11E  
 - Watson Bar area see sketch of area  
 VG in SS (Jackass Mtn. Gp)  
 in gtz veins, conformable  
 silic. replacements + massive  
 sul. veins peripheral to silic.
