Sampling — sawed + chisled

LEVEL (S)

incl. strong inward fracturing

Photo 6 - water coming out of wedged ('capped') drill holes (No lots)

⇒ see coloured signals

East Zone - looked at recent core  
- geologic (bx) zone there but  
not grade. Some earlier  
surface holes yielded ~200ft Au  
but 4/8 ddh much less (eg. < .200ft Au)

KEY INDICATOR in West Zone is  
lavender anhydrite

- CPY-py appear to occupy  
open spaced fractures here is  
this an upward pressure or  
a collapsed caldera?

~ 72,000 ft of ddh to date  
Sampling (assay) problem for gold has been  
resolved i.e. better grinding - no  
apparent correl. with Cu grades
