SUMMARY

This assessment report presents results of drill hole EC-79-1 on the Erie Creek property on June 1 and 2 claims. The hole was drilled by AMAX of Canada Limited between November 3, 1979 and December 14, 1979.

The property is located 11 km northwest of Salmo in southeastern British Columbia. The property consists of June 1-7 claims and 21 reverted crown granted claims acquired over the period 1976 to 1979. The property is wholly owned by AMAX.

Diamond drill hole EC-79-1, driven to a depth of 452 m (1,483') encountered biotite quartz monzonite, and feldspar porphyry and quartz feldspar porphyry dykes. Molybdenite and minor chalcopyrite and scheelite occur in quartz vein and fracture stockworks.

A field cost of \$61,839.01 was applied as assessment to the following claims:

- 5 years June 1, 3, Good Enough, Copper King, Monte Carlo, Gordon, Nelson, St. Louis, Pockford, Ontario, Westminster Fr., Maude S, Arnold
- 4 years June 2, Ben Hassen
- 3 years June 4, 5.

CONCLUSIONS

Diamond drill hole EC-79-1 encountered a complex acid dyke system that cuts a biotite quartz monzonite stock. Early in the intrusive history of the complex molybdenite - minor chalcopyrite mineralization took place. The best intersection in EC-79-1 was 54 m of 0.058% MoS₂ in a very well developed quartz vein and fracture stockwork 156 to 210 m below surface. Intensity of quartz veining and molybdenite mineralization decrease abruptly below a 17 m wide fault zone at 217 m.

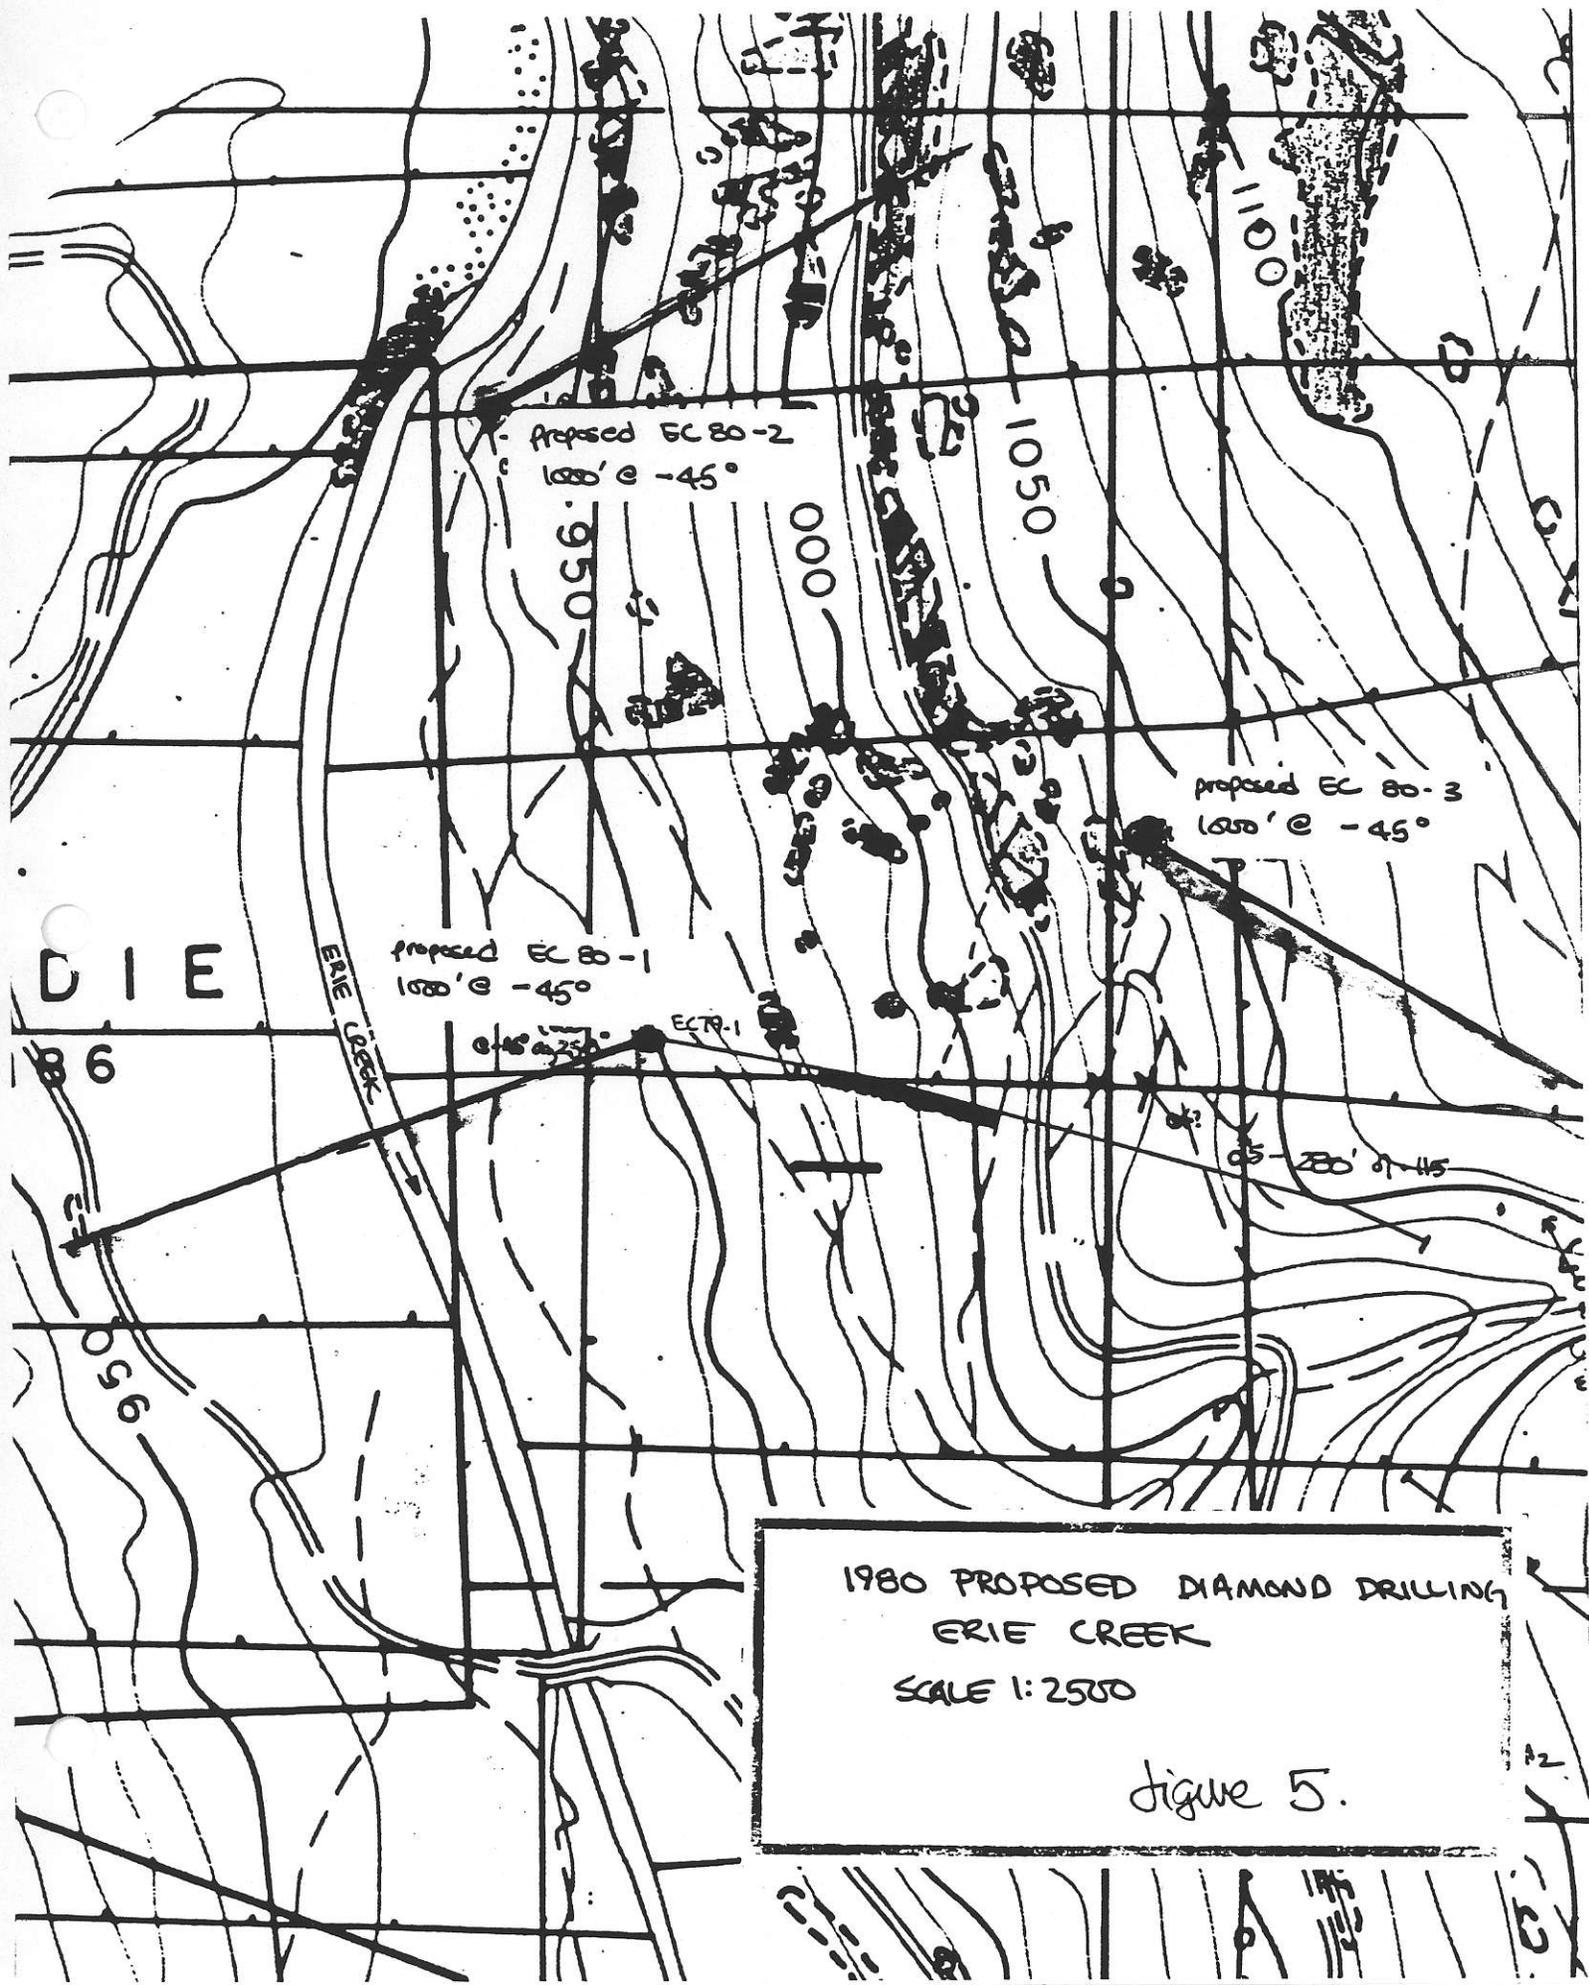

The Erie Creek property has the potential for a low grade, near surface, stockwork molybdenum deposit with minor tungsten and copper.

RECOMMENDATIONS

A total of 3000 feet in three new holes is recommended for Erie Creek property (Figure 5). Specifically, the holes would be: EC-80-1 - to be located on the same site as EC-79-1 with a proposed depth of 1000 feet, azimuth 250°, and dip -45°. This hole is spotted to test the western extent of mineralization intersected in the upper part of EC-79-1.

EC-80-2 - located 220 m north of EC-80-1 on the east bank of Erie Creek with a proposed depth of 1000 feet, azimuth 60°, dip -45°. This hole is spotted to test depth extent of surface mineralization and lateral continuity of mineralization encountered in EC-79-1

EC-80-3 - located 180 m northeast and 90 m above EC-80-1 with a proposed depth of 1000 feet, azimuth 120°, dip -45°. This hole is spotted to test and confirm grades in the 0.1 - 0.2% MoS₂ range encountered in drilling done by McIntyre in the late 1960's.

1980 PROPOSED DIAMOND DRILLING
ERIE CREEK
SCALE 1:2500

figure 5.

Total cost of the 3000 foot program is estimated at \$140,000 based on last year's drilling costs and allowing for 10% inflation and substantial increases in field costs in 1980. Recommended time for the project is May 1 to July 15, 1980.

INTRODUCTION

This report documents a one hole diamond drill program carried out on the Erie Creek property in the fall of 1979.

Location and Access

The Erie Creek property is located 11 km northwest of Salmo, B.C. at 49°25'N latitude, 117°20'W longitude in the Nelson Mining Division (NTS 82 F/6) as shown in Figure 1. The property is reached by a well-maintained logging road which intersects Highway 3A 3 km west of Salmo, B.C.

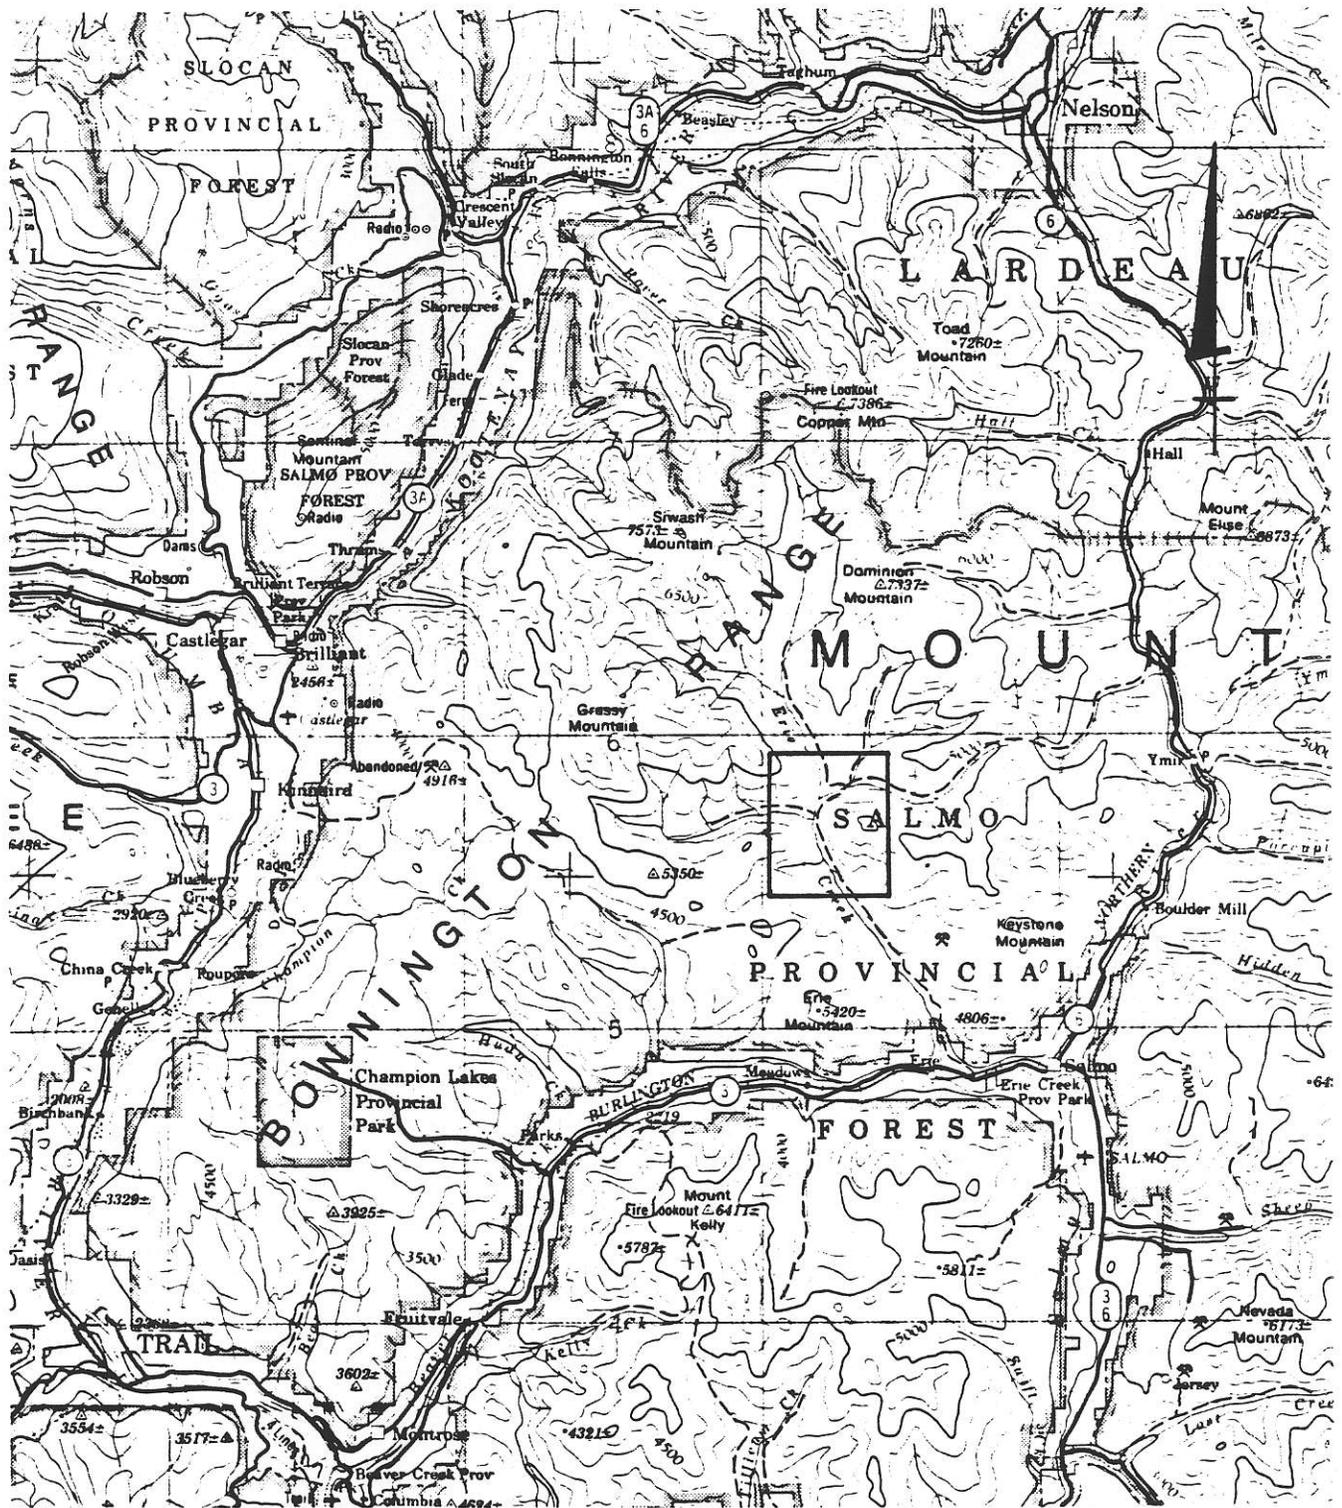

Claims

The property consists of the June 1-7 claims staked on behalf of AMAX Potash Limited and 21 reverted crown granted claims (Figure 2). Claims data are summarized below.

Claim	Record or Lot No.	No. of Units	Expiry Date
June 1	223	4	June 21/80
June 2	224	8	June 21/81

CLAIM MAP

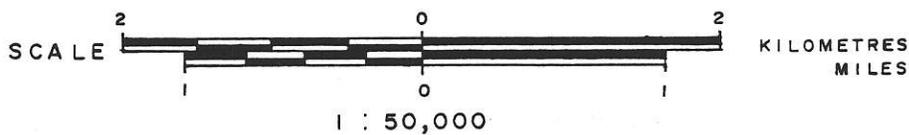

FIG. 2
 N. T. S. Ref. 82F386

A geophysical assessment report was filed on the property in November, 1979.

Physiography

The claims lie on the slopes and valley of Erie Creek between elevations 915 and 1400 m (3000 and 4700'). Topography is steep but not rugged.

Outcrop is abundant above alluvium and till that cover the lower slopes and valley of Erie Creek.

Mixed stands of cedar, Douglas fir, balsam fir, hemlock, larch, birch, poplar and alder cover the property. Locally, thick patches of slide alder cover the slopes.

1979 DRILLING

General Statement

One NQ/BQ drill hole was driven to a depth of 452 m (1483') during the period November 3 to December 14, 1979. The drill hole was collared in the valley bottom at elevation 950 m (Figure 3). It was set at an inclination of -60° on a bearing of 100° azimuth. Contractor for the job was Connors Drilling of Vancouver using a Longyear Super 38 drill.

Core recovery averaged better than 98% over the entire hole. All core was logged and split in 4 m intervals. Splits were geochemically analyzed for Mo, Cu, Ni, Co, Pb, Zn, Fe, Ag, Mn, W, Au and Sn by Rossbacher Laboratory, Burnaby. The core was stored on the property.

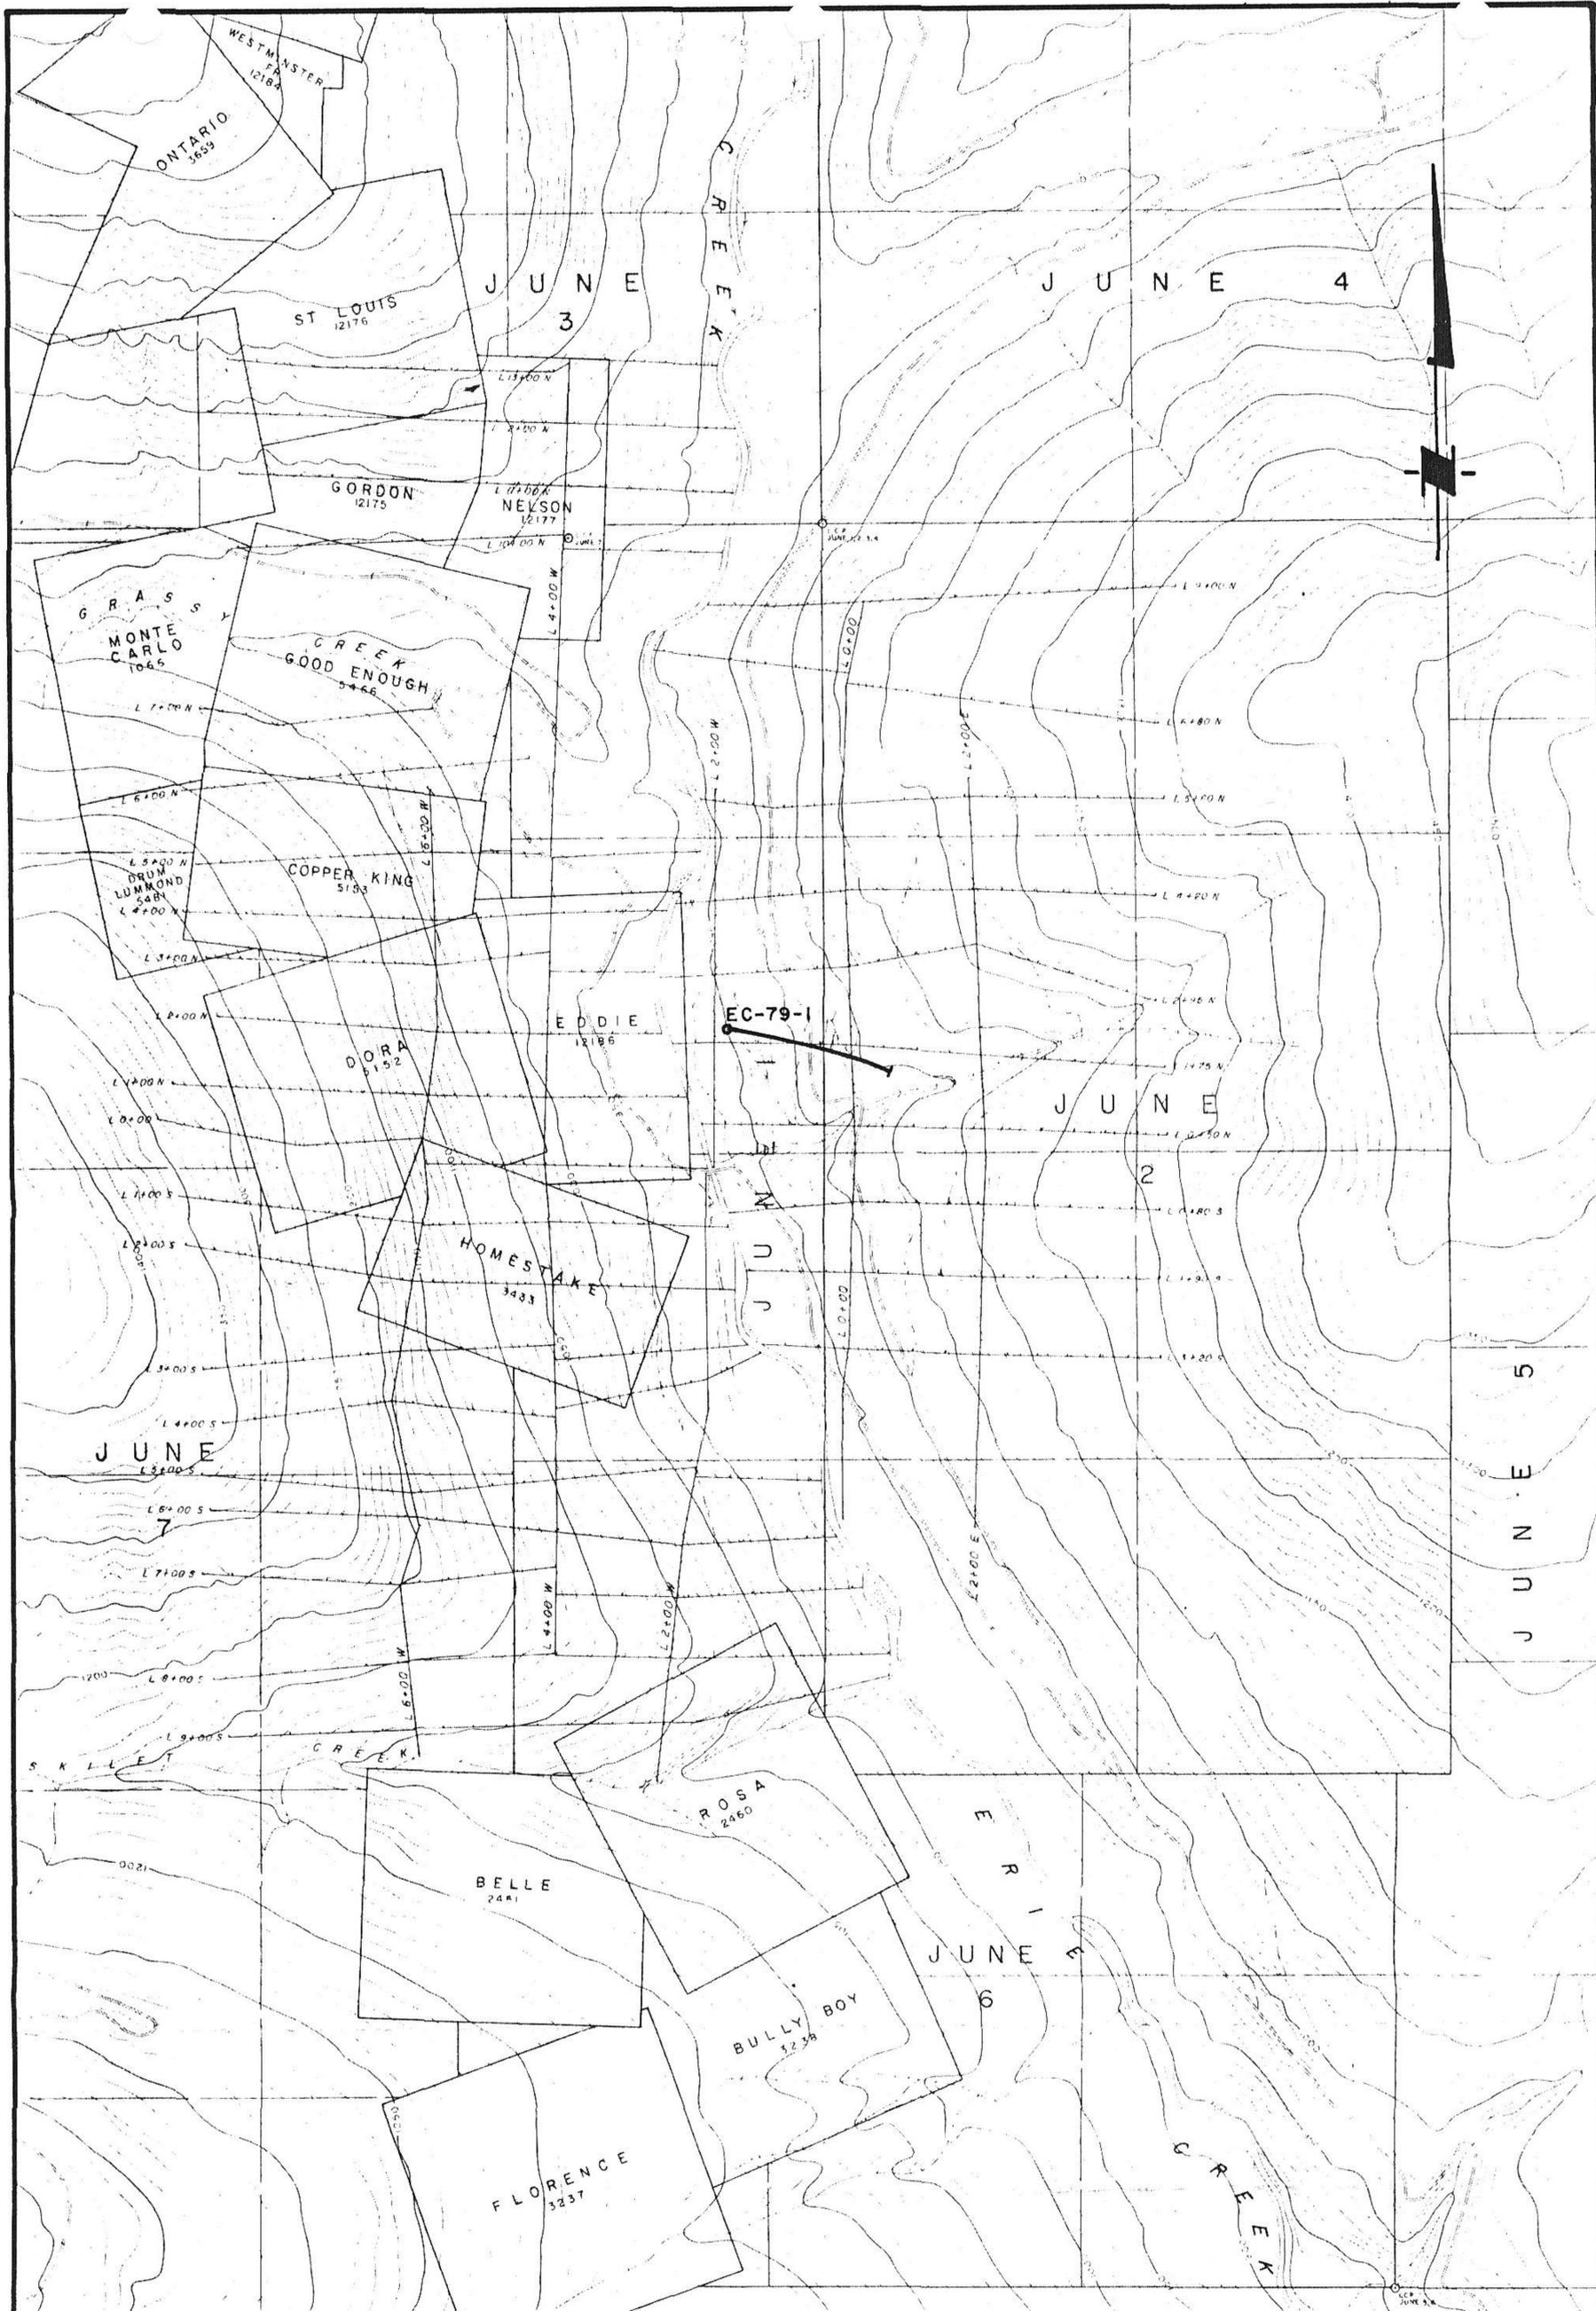

Results

The oldest rock type is a medium grained biotite quartz monzonite (Unit 4). The biotite quartz monzonite has been intruded by numerous dykes of several types, which from oldest to youngest are:

- Unit 5 - pink quartz-feldspar porphyry
- Unit 6 - black feldspar porphyry, feldspar-biotite-quartz porphyry, composite dykes of the above and feldspar megaporphyry dykes
- Unit 8 - light grey quartz feldspar porphyry
- Unit 9 - late black feldspar porphyry and feldspar biotite quartz porphyry dykes.

Units 4 and 5 are pre-mineral, Unit 6 intra-mineral and Units 8 and 9 post-mineral.

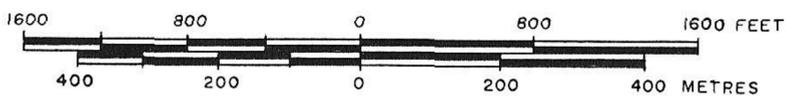

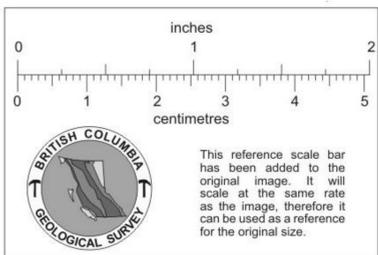

Two large faults were intersected in the core, one between 151 and 153 m and a larger one between 206 and 217 m.

FIG. 4

In the larger fault the original rock has been argillized beyond recognition. Numerous small slips occur throughout the length of the core.

Fracture and quartz vein stockworks (greater than 40 veins and fractures per metre) occur in Units 4 and 5 in the intervals 48-56 m, 104-142 m, 156-127 m, and 296-314 m.

Highest molybdenite grades are coincident with stockwork intervals: the best intersection between 156-210 m of 54 m averages 0.058% MoS₂. Average grade in Unit 4 and 5 (pre-mineral) is 0.025% MoS₂.

Pyrite averages less than 1% throughout the core. Pyrrhotite occurs in trace amounts only.

Chalcopyrite occurs as fracture coatings with pyrite and pyrrhotite and rarely with molybdenite. Copper content averages 200 ppm.

Scheelite occurs rarely as scattered fine grains on fractures and in quartz veins.

A complete drill log is entered in Appendix II.

All sample numbers and results are entered in Appendix III.

34				24	60	60904			68	15	4	3	5	2							31.2 - 32.7 P bqm w/ qtz vein stockwork - not as well developed here but includes frgs siliceous phases & includes frags of dark brown hornblends hornblends w/ x-tal aggregate of Feldspar? white radiating masses & bluish drags conspicuous.
36				28	10	"				10	2	1	2	-							32.7 - 33.5 brown po rich - 3% hornblends frag? w/ conspicuous F phenes in frgs brown groundmass maybe FP dyke cutting thro here too!
38				22	10	60905			58	-	4	-	2	3							34.5 - 35 well structured qtz heeded P bqm - fracturing is locally very intense
40				23	100	"				5	10	2	15	1							35 - 35.3 po rich brown FP - phenes are distinctly rounded upto 20 mm sharp 20°CA contact to light grey
42				37	10	60906			70	-	4	2	-	-							35.3 - 39 light grey unmineralized unfractured P bqm with feldspars conspicuous (20mm) in fine grained groundmass Fphenes 2% qtz phenes 10mm < 1% biotite 2% diaspore po to 1/2%
44				15	10	"				18	4	3	2								39 - 39.1 black FP dyke
46				21	100	60907			94	25		5	8	2							39.1 - 39.9 light grey microfractured & necked w/ qtz veins and pyrite structures. 1% pyrite frgs diaspore - fine grained equigr.
48				12	100	(1)				2		2	1	-							39.9 - 40.9 light grey FBP aphanitic groundmass - gradational contact (?) to - cut by vertical qtz MoS ₂ veins trace py
50				17	100	60908			280	40		5	10	2							40.9 - 41.6 dark grey FBP w/ 10% Fphenes aphanitic dark groundmass gradational to trace py
52				29	100	"				stockwork qtz veins 20/20cm											41.6 - 43.1 very dark brown sparse FP 2-5% phenes aphanitic to dg groundmass. white rounded Fphenes. trace py.
54				10	100	60909			92	stockwork & qtz vein - pyrite breccia											43.1 - 44 - microfractured bqm w/ qtz veins and MoS ₂ ool(?)
56				29	100	"				3	2	1	3	2							44 - 44.05 - brown FP dykelet to
58				14	100	60910			18	-	-	-	-	4							44.05 - 44.2 FBP aphanitic matrix.
60				60	100	"				3	3	-	2								44.2 - 45.4 aplite breccia w/ qtz vein frags - aplite & some light grey fine grained or comminuted? rock w/ frags of black FP, bqm & FBP included. - bx cut by pyrite fractures and MoS ₂ qtz.
62				15	70	60911			26	1	-	-	3	2							45.4 - 46.3 microfractured & mineralized P bqm w/ some qtz rich phases two ribbon banded qtz w/ MoS ₂ . trace 1/2% py
				12	100	"				1	-	-	3	2							46.3 - 48.1 - brown black unmineralized trace FP and FBP (gradational) includes frags of microfractured mineralized P bqm

- 48.1 - 47.2 microfractured Pbqm - very well developed quartz vein stockwork trace MoS₂ v. big. quartz veins generally larger to 20 mm on the brown FP dykes.
- 47.2 - 47.4 black FP.
- 47.4 - 47.3 stockwork in Pbqm - qm phases of equigranular bqm and subophytic gradational & intermixed. stockwork better developed in medium grained - fine grained equigranular than in Pbqm.
- 50.3 - 50.7 black FP w/ frags of stockwork Pbqm - mafics (brihte to 10% - dark)
- 50.7 - 52.7 dark grey (brihte to 12%) microfractured qtz healed and qtz by MoS₂ veins Pbqm. Smoky quartz masses up to 50 mm size w/ MoS₂, epidote, pyrite
black fractured FP
- 52.7 - 53.1 crackle bx of light grey FBP (brihte medium grained 2%) aphanitic matrix - matrix of comminuted rock and pyrite
- 54.1 - 55.5 FBP w/ pyrite @ 1/2% trace cpy on F pheno borders - weakly developed foliation brachytic texture in brihte - includes frags of brown FP.
- 55.5 - 58.2 angular fragment? of brown FP - some brihte phases - contact is angular & slick - even some flow bending in FBP (grey) around frag edges. in brown FP plenos of white F up to 30 mm.
- 58.2 - 61.5 grey FBP - rare smoky qtz phases up to 5 mm - dense pyrite 1/2% trace of ps and cpy. v. fg. rock in aphanitic matrix F phenos white to 15 mm - brihte medium to fine grained (1-2 mm) 3%.
- 61.5 - 62 dark grey - black FP fragment? py - carb fractures
- 62 - 62.4 crowded FBP cuts black FP - 70% rounded and embedded white phenos and smoky qtz (2 mm) atz phenos 10% of total pheno count. definitely cuts FP.
- 62.4 - 63 black FP border to
- 63 - 63.7 interior phase? of FBP composite dyke.
- 63.7 - 65.45 brds. phase of black FP minor brihte, trace py, po rock is not well structured 1/10 cm.
- 64.46 - 66.8

MoS₂ veins cut all by below
qtz vein stockwork.

180.1 - 182.4 brown hornfels FP w/ Mo fracture & veins - slickensides on
MoS₂ vein here. py, po, cpy rare. includes several mineralized
trags of bqm - ϵ is cut by qtz-Mo vns itself.

1) bqm \leftarrow FP? (hornfels)

1a qtz vein stockwork w/ Mo

2) FP

2a qtz vein stockwork w/ Mo

182.4 - 182.7 pink quartz QFP dyke cut FP and bqm.

182.7 - 184 bqm - w/ Mo in qtz - along margin & down in larger
surveys qtz vns.

184 - 188.4 brown and black FP w/ qtz vns, qtz Mo vns ^{ϵ parallel to melt - Mo vns} 1/5 cm. some
all settings vns < 2% white F phenos.

188.4

black FP rips up drags from white ^{APLITE} ~~spars~~ FP w/ 2-3% biotite
in fine grained siliceous gnd mass. well developed qtz vein stockwork w/
.02 range MoS₂. w/ 12 vns/20 cm. 2-3 in mineralized.
2-3% biotite cut by (?) ϵ with less Mo qtz
veins

248 - 248.9

fine-medium grained equigranular bqm - bleaching strong along chlonite - calcite fractures - subfl @ 20°C.

248.9 - 249.1

ripped up frags of dk brown - black FP cut by dk kylets of bqm - still bleached by chl-calc fractures - chl is clay?

249.1 - 250.4

QFBP dyke - frags of FP included - not microfractured like bqm & aphanitic groundmass but still cut by clay-calcite bleached fractures. fr scattered by Mos₂ on dry fractures & qtz vn. cuts bqm & QFBP.

250.4 - ~~252.7~~

microfractured bqm - weak qtz vn'g trace Mos₂ on fractures & qtz vns includes FP frags (bleached) - 5% pyrite^{fr}, po, cpy on fractures.

252.7 - 253.1

bleached FP frag in bqm (some sub porphyritic phases) FP cut by qtz vns & py now too.

253.1 -

weak qtz vn - fracture stockwork in bqm

253.2 - 254.3

weak to moderately argillized bqm w/ pale yellow chl-clay mineralization on late fractures - some coarse calcite masses

Mos₂ vdy scattered ground to vdy point on 5% of total fractures & qtz vns.

- 5% py disseminated structure, trace po, cpy
- some pyrite phases.

MoS₂ is dusting w/ py, pc on fractures
qtz MoS₂ vng. Alset by py-pc fractures.
