MINER MOUNTAIN DRILLING RESULTS - James W. McLeod

P.Geo., president,
reports Nustar Resources Inc. and 50/50 joint venture partner
Frontier Minerals Inc. have received the assay results from diamond
drill hole DDH 00-1 at its Copper Mountain Syndicate property on
Miner Mountain at Princeton, southwest BC in the Similkameen
Mining Division, BC.

The drill hole was undertaken on the zone mid-way between
holes, DDH 97 1-4 drilled in 1997 and the most eastern mineral
inventory of 600,000 tons of 0.25% copper in the Bethlehem zone.
The current vertical drill hole, DDH 00-1, was completed to a depth
of 453 feet and intercepted the Nicola volcanic section at 303 feet.
The complete assay results from Acme Analytical Labs are tabled
OVERLEAF P.2.

In summary, the hole encountered an alteration zone of gypsum
(anhydrite) and pyrite from 52 to 303 feet. Anomalous copper values

began to be encountered at 173 feet and continued intermittently to
233 feet and possibly 303 feet where the copper zone was
intersected. The continuous 130 foot section from 303 to 433 feet
returned weighted copper values of 0.25% copper. Contained within
this section from 353 to 433 feet is an 80 foot interval which
returned weighted assays of 0.34% copper and gold equivalent values
of (gold + platinum + palladium) of 0.01 oz/ton. The section 388 to
418 feet (30 feet) returned weighted values of 0.52% copper and gold
equivalent of 0.018 oz/ton. The section 403 to 418 feet (15 feet)
returned weighted values of 0.597% copper and gold equivalent of
0.022 oz/ton.

The joint venture partners anticipate conducting further drilling
on the property. (SEE GCNL NO.84, 2May2000. P.4 FOR
