SEVEN MILE HIGH GROUP INC. (SVH-V)

1990 WORK PROGRAM - Craig S. Harrison, secretary,

reports Seven Mile High Group Inc. (40%) has received the proposed 1990 work program from Inco Gold, the operator, which has a 60% interest in the Vault claims near Okanagan Falls, B.C. (SEE GCNL Nos.

206, 180, 158 & 136 FOR EARLIER RESULTS) The objective of the 1990 program is to define extensions of the known epithermal gold mineralization, to determine variability in gold grade and vein width of the North vein and to conduct bulk sampling. Diamond drilling to date has outlined a large gold system over an area of 1,300 meters by 500 meters. Within this system, the Central zone contains gold mineralization in quartz veins and stockworks, and a North zone consists of a 1,100-meter long, steeply dipping, quartz-calcite-adularia vein. The Central zone will require underground exploration.

The North vein has been partially drilled and has a drill-indicated mineral resource of 152,000 tonnes grading 14 grams gold/tonne. Additional drilling at depth and to the west is planned.

The Western extension of the Central zone may contain higher grade zones similar to those indicated in the Central zone, but at depths of less than 200 meters. Additional drilling is proposed.

The program, which includes diamond drilling and bulk sampling, is in two phases and will cost \$1,100,000.
