LYSANDER GOLD CORPORATION (LYS-V)

DRILL PROGRAM UNDERWAY- Lou Duarte, president of Lysander Gold has reported analyses from recent trenching at the CAT property have yielded significant widths of copper/gold mineralization which may indicate the presence of a major porphyry environment.

Lysander has an option to earn a 50% interest in the CAT property and an option to earn a 100% interest in the internal BET claim. The property, accessible by road, is located 90 miles NW of the Mt. Milligan deposits 150 miles north of Prince George, B.C. and is in a similar geological setting.

The trenching program has been based on the presence of bornite, chalcopyrite and gold bearing magnetite veins hosted by altered volcanic units adjacent to a syenite stock. Trenching results have been used to select initial drill targets. Trenching has been completed across only a portion of the apparent width of mineralization on two zones exposed on Cat Mountain. Significant results of the program are shown IN OVERLEAF PAGE ONE.

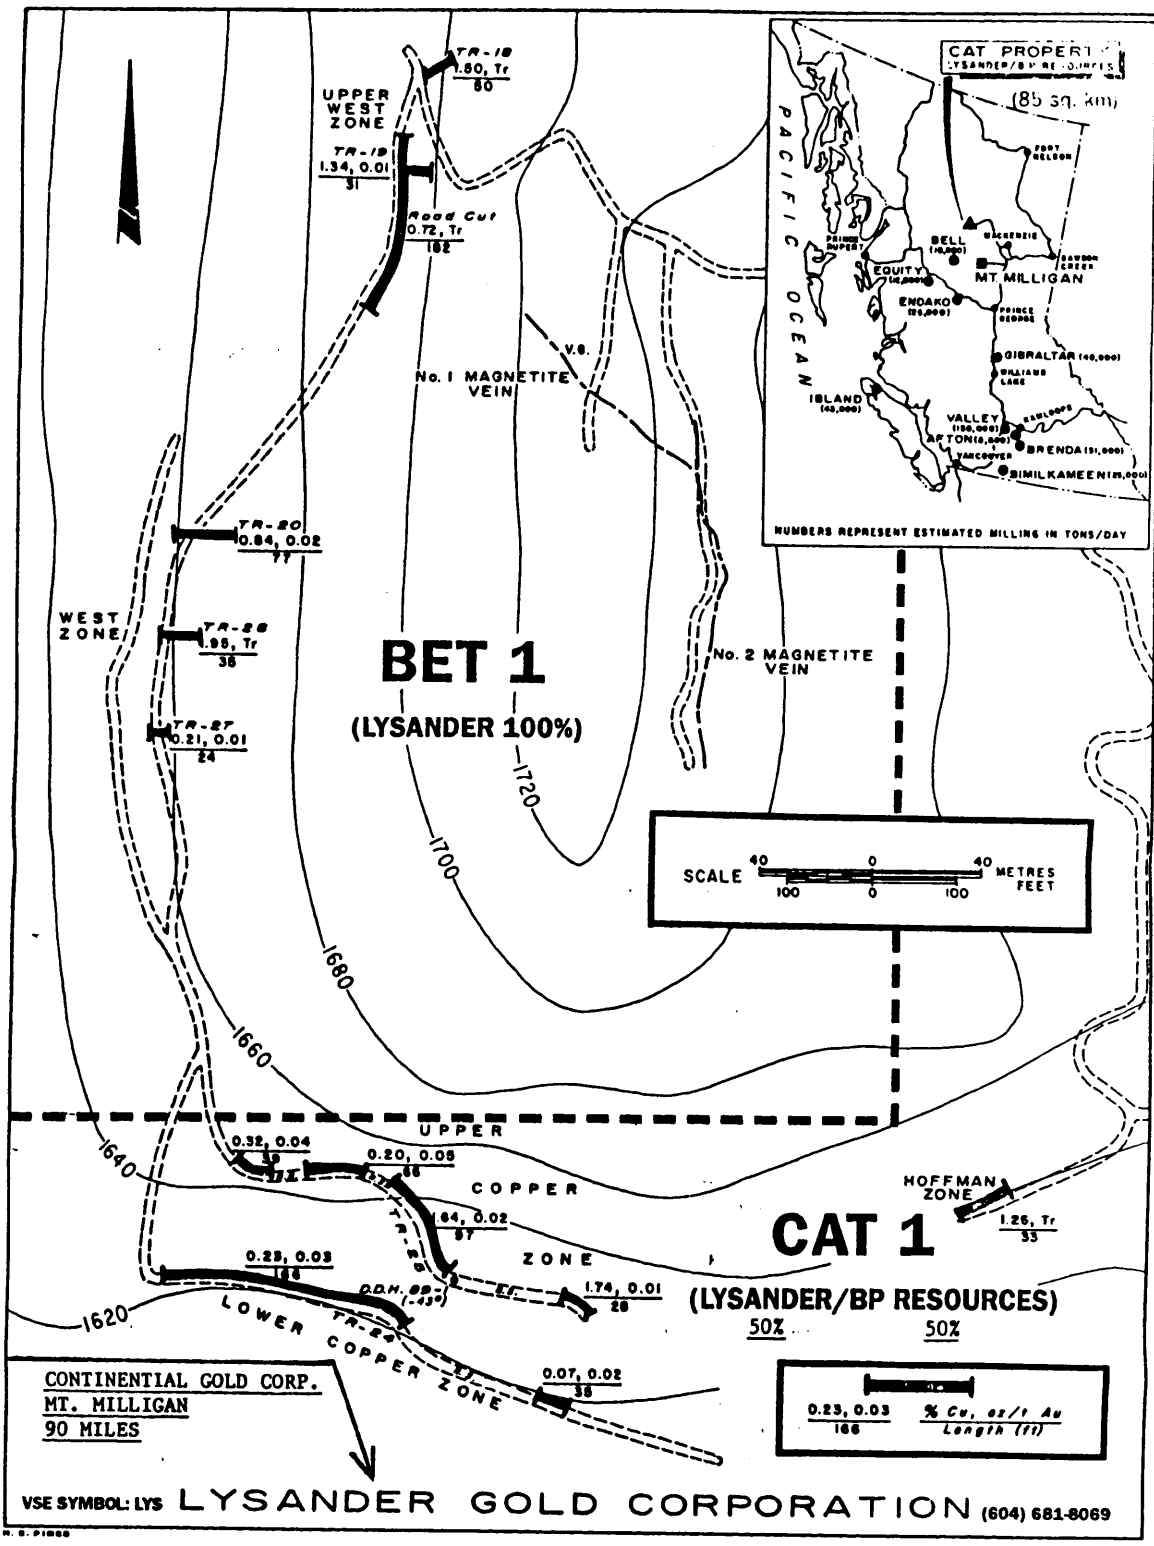

A 2,000 foot diamond drilling program started Oct.9, 1989.
