89-6	61.1 - 68.4	7.3	24	1.6	3.2	0.8
89-9	76.2 - 86.7	10.5	35	3.7	3.2	0.7

MT. ALCOCK MINERALIZATION EXPANDED - John S. Brock, president, reports six of nine drill holes have traced the Mt. Alcock barite/zinc/lead horizon over a strike length of 230 meters and to a depth of 130 meters. The prospect is located 240 km NW of MacKenzie, B.C. The mineralized zone consists of barite with 10%-20% sulphides averaging 11.5 meters thick. Within the district, barite is generally peripheral to massive sulphides with higher zinc/lead values.

An induced polarization survey is being completed over the central portion of the 2.5-km long zinc/lead geochemical anomaly. Drilling will then resume to test the zone for massive zinc/lead sulphides along strike and to depth from the presently defined mineralization. (SEE GCNL Nos.197 & 185 FOR EARLIER RESULTS, FINANCIALS & MAP)
