DOROMIN RESOURCES LTD. (DOI-V)

EXPLORATION UNDERWAY- Marino Specogna, director, reports that exploration is underway at its 80-unit Cimadoro property 35 km west of Sandspit, Queen Charlotte Islands, B.C. Doromin has an option/joint venture agreement whereby TECK CORPORATION (TEK.A-V,T,M) can earn a 60% by taking a series of 4 private placements of flow-through shares over 4 years.

On the Cimadoro prospect, banded massive to semi-massive sulphides occur at the contact of mafic volcanics and interbedded rhyolites. Mountaineering techniques were required for mapping and sampling due to the steep terrain. Assays from this work are pending.

Two grids were established on the NW and SE projections of the massive sulphide zones. Soil sampling, electromagnetic and magnetometer surveys and geological mapping are nearly completed. Rehabilitation of the existing logging road on the property have been completed to permit mobilization of drilling equipment. Scheduled to start within two weeks, the initial 3,000 ft of drilling in five holes will test the area of the main sulphide showings.(SEE GCNL No.112, 12Jun89 p2 FOR SAMPLE RESULTS)
