POLARIS-TAKU MINE - Craig Angus, president of Suntac
RESERVE ESTIMATES Minerals Corp., reports that exploration and development program at the
Polaris-Taku mine project was completed in late July and
data has been compiled to calculate ore reserves. The

project is located in NW B.C., 60 km east of Juneau, Alaska on the Tulsequah River. Suntac may earn a 60% interest by spending \$3,000,000 over five years. A total of 17,000 feet of drilling has been completed by Suntac that was designed to test the Y-vein system down dip and along strike of previous mine workings. Suntac's drilling along with the mine's previous operator was used in the reserve calculations.

The reserves remaining within the developed area of the mine have been calculated from underground sampling data and are based on a cut-off grade Of 0.15 oz.gold/ton and a minimum five-foot mining width.

Additional drill indicated reserves have been calculated utilizing data from all of the old and new drill hole intercepts. These reserves are classified as probable and possible and have been calculated at cut-off grades of both 0.15 oz.gold/t and 0.25 oz.gold/t using a minimum five-foot mining width.

Based on the currently available data, the reserve potential is estimated to be at least 1,450,000 tons grading 0.38 oz.gold/t. in the area between surface and the bottom of the existing shaft, the 750 level. There is potential below the 750 level as indicated by the 10-foot intersection of the A-B vein at 0.32 oz.gold/t and 28.1 feet of 0.685 oz.gold/t.

With the deposit still open at depth and along strike, further drilling is required to delineate the dimensions of the deposit. Suntac is seeking further financing for the project. (SEE GCNL No.130, 116, 95 & 75 FOR EARLIER RESULTS)
