CONSOLIDATED GOLDWEST RESOURCES LTD. (KGG-V)

PUP PROJECT SUMMARY - Murray Pezim, chairman,
Consolidated Goldwest Resources
Ltd., provides a summary of exploration work on the Pup
project located in the Galore Creek mining camp some 150
miles northwest of Stewart, B.C. Goldwest is in the
second year of a four-year option to earn a 100%
interest in the Pup project. The property is comprised
of seven claims totalling 101 units covering 6,200
acres, centered about eight km. north of the Central
zone of the Galore Creek porphyry copper deposit which
hosts 125,000,000 tons grading 1.06% copper.
Exploration in 1989 by Goldwest discovered two areas of
interest, the Saddle and Malachite zones, the focus of
the 1990 work.

This season's program included grid establishment,
mapping, soil sampling, VLF-EM and magnetometer surveys,
primarily on the Saddle zone, which features several
parallel, northerly-trending shear zones covering an
area some 300 meters wide by 1,700 meters long.
Associated with the shears are irregular sulphide-bearing
quartz veins. Grab samples from the Saddle zone
returned assays as high as 1.92% copper and 1.91% zinc.,
and 0.038 Oz.gold/ton, 1.95% lead and 3.4% zinc. The
1990 soil sampling showed a strong gold and copper
anomaly up to 200 meters wide, coincident with the
Saddle zone; soil assays were up to 0.041 oz.gold/ton.
The VLF-EM survey showed a north-trending conductor over
the known length of the Saddle zone, offset about 50
meters to the east of the geochemical anomaly.

Work on the Malachite zone comprised mapping,
prospecting and contour soil geochemical sampling. The
best grab sample result was 0.036 oz.gold/ton and 2.05%
copper. A third area of interest, the Pickston zone,
was discovered in 1990. Eleven grab samples from a
gossanous shear zone, which comprises the zone, returned
anomalous copper assays in the 150-5300 parts per
million range.

Consolidated Goldwest has also recently completed
its 1990 exploration program on the Teryl Option project
with TYMAR RESOURCES INC. (TMZ-V,T), located in the
Iskut River area, 100 miles NW of Stewart, B.C. and four
miles northwest of the Prime/Cominco SNIP deposit. (SEE
