MORE SILVER DAWN ASSAYS - Harry Chew, director, reports, Rock Creek Resources Ltd. has received lead and zinc assays from the diamond drilling program on the Silver Dawn property located near Rock Creek in south-central B.C. The company is earning a 100% interest by paying \$5,000 and issuing 100,000 shares. (SEE GCNL No. 138, 18Jul90, P.2 FOR PREVIOUS RESULTS) See table above for new assays. Drilling comprised 3,105 feet in 13 holes with mineralization encountered in every hole; some holes had several intersections. The high grade mineralization in a dark siliceous breccia hosted within an iron magnesium carbonate appears to be flat-lying. The summary was calculated using a weighted average across the mineralized sections.

Results to date show the deposit lends itself to possible open-pit mining methods since the mineralization occurs from 25 to 150 feet from surface. The area drilled covers only 200 by 200 feet and is open for extension. The drilled area is a small part of one of the anomalous areas with at least five areas remaining to be tested. Rock Creek is planning a further 10,000-foot drilling program to further expand the current area and to test other anomalous areas. Several major mining companies have expressed interest in a possible joint venture or financing.
