## PACIFIC SENTINEL GOLD CORP. (PSG-V)

DIAMOND DRILL RESULTS - Robert A. Dickinson, president, reports Pacific Sentinel Gold received assay results from 18 diamond drill holes at the Great Western Star property near Nelson, B.C. The company can earn a 70% interest in the property by paying \$492,550 by 1996 and spending \$3,000,000 on exploration by 1994. Upon earn-in, further costs will be shared by partners: Pacific Sentinel 70%, LECTUS DEVELOPMENTS LTD., 15% and REYMONT GOLD MINES LTD., 15%.

Two drills are testing 6 targets on the 11 square mile claim group. The 15,500 feet drilling has been completed and intersected values over a 16,000-foot trend, from the Toughnut target in the SE to the Ron target in the NW. SEE MAP OVERLEAF PAGE 2 - SEE DRILL RESULTS OVERLEAF PAGE 3.

Drilling at the Alma N target intersected disseminated gold values at a monzonite/volcanic contact with disseminated pyrite hosted within altered monzonite and volcanics. This zone has been traced for 6,000 ft. Additional drilling is planned. The Star and Eureka targets are hosted within altered and fractured monzonite with mineralization comprising disseminated and fracture-controlled pyrite, chalcopyrite and magnetite. Significant sections of mineralized monzonite have been intersected in widely-spaced holes over a 4,000-foot strike length.

The Toughnut gold/zinc/copper target is a 6,000 foot long coincident geophysical and geochemical anomaly. Intermediate to felsic volcanics have been sheared and altered by the 3,000-foot wide Silver King shear zone. Current drilling focused on a gold-enriched zone and intersected stringer and semi-massive sulphide mineralization. A 1,500-foot step-out is planned to test a zinc/gold zone. Two holes in the Ron target with one cutting erratic copper/gold values over the entire length and the second cutting 14.3 feet grading 1.25% copper and 0.011 oz.gold/ton. More drilling is planned. (SEE GCNL No. 217, 10Nov89, P.1)
