NOTE: This hole was still in mineralization at depth.

CHUCHI LAKE DRILL RESULTS - Bill Scott, director, reports Digger Resources Inc. and operator 50/50 joint venture partner BP Resources Canada Ltd. have completed the 1990 drilling program at the Chuchi Lake property located 20 miles north of Continental Gold's Mount Milligan project which is 30 miles west of MacKenzie, B.C. Drilling continued up to hole 38 when adverse weather conditions set in. See table above. Drill holes 34, 36 and 37 were testing an unclosed extension of the Chuchi porphyry system to the northeast; the zone remains open to the northeast and east. Drill hole 38 is to the north and outside the zone. Hole 35 was abandoned due to technical problems. The extension to the northeast and east (Eastern anomaly) measures at least one km square with supportive and coincident copper/gold geochemical and induced polarization and resistivity geophysical anomalies. The Eastern anomaly will be drill-tested in 1991. Drilling will also take place next year on the Western anomaly, about 1.5 by 0.7 km, that lies to the northwest of the 1990 drilling.

The Multi-Element anomaly requires further drill testing since only a portion of the one km square zone was probed by 1989 drilling.
