BIG M RESOURCES LTD. (BIM-V)

INITIAL ASSAYS RECEIVED - John Barclay, director,
reports Big M Resources Ltd.
has received partial analytical results for the first
three of four holes completed on the Cooper occurrence
in the southeast part of the Waratah property in the
Iskut River area of northwest B.C. Big M can earn a 50%
interest from TUNGO RESOURCES CORP. by paying \$100,000
cash, issuing 200,000 shares and spending \$500,000 on
exploration over three years. Holes 1 and 2 were
drilled to the south and did not intersect the
mineralized structure. Hole W90-3 drilled to the north
beneath the middle trench that returned chip sample
values of 0.59 oz.gold/ton over 4.8 feet and 0.25
oz.gold/ton over 9.8 feet intersected mineralization
that appears to be related to a structure striking
120° dipping 55° south. The available results are:

HOLE NO.	INTERVAL FEET	LENGTH FEET	GOLD OZ/T	These results
W90-3	10.0 - 47.2	37.2	pending	' indicate that gold
	47.2 - 52.2	5.0	0.453	' values comparable to
	52.2 - 64.3	12.1	367ppb	' the trench results
	64.3 - 73.5	9.2	.061	' on the Cooper occur-
	73.5 - 103.3	29.8	724ppb	' rence are present
	103.3 - 216.0		pending	' within a broad en-

' richment. Further
results from the surface exploration program indicated
the possibility of a parallel mineralized structure
situated 1,200 feet to the north, where a narrow shear
zone assayed 0.363 oz.gold/ton. In addition, a sample
of angular float from the same area returned a value of
0.446 oz.gold/ton. Drilling will continue testing the
zone along strike and to depth in a few days.
