

VECTOR INDUSTRIES INTERNATIONAL INC. (VII-Alberta)
GOSSAN DRILL RESULTS - R.S. Hewton, president, reports
Vector Industries International
Inc. has received assays from the program on the 60%
owned Gossan property 90 km NW of Stewart, B.C. Ecstall
Mining/ Chris Graf own the other 40% property interest.
The property is south of the Prime/Cominco SNIP mine,
west of Eskay Creek. Exploration included induced
polarization surveys and rock and soil sampling. SEE
TABLE OF DRILL RESULTS OVERLEAF PAGE 1 AND MAP OVERLEAF
PAGE 2. Diamond drilling in the A zone in 1985/87
encountered numerous wide intersections of gold, silver,
copper, zinc, within which were narrower intersections
of higher grade gold. Drilling in 1990 confirmed this
mineralization with the best intersection being 9.8 feet
grading 0.236 oz. gold/ton and 0.23 oz. silver/ton.

Northeast of the A zone is a geologically similar area
called Zinc Hill where 1985/87 drilling indicated
numerous high zinc values, often associated with gold.
Two holes drilled west of the main focus of drilling
returned very high values; see holes 90-7 and 90-9.
Rock chip sampling in the West zone, located west of the
A zone, returned numerous anomalous values for gold,
silver and copper. Individual samples range as high as
3.3 feet grading 0.33 oz. gold/ton and 0.65
oz. silver/ton, but areas of greater interest are 9.8
feet of 0.187 oz. gold/ton, 0.45 oz. silver/ton and 0.12%
copper and 19.7 feet grading 0.154 oz. gold/ton, 0.46
oz. silver/ton and 0.85% copper.

At the Pyramid Hill area, drilling centred on a
skarn target 2.0 km southeast of the A zone target and
intersected 491 feet of 0.14% copper and 306 feet of
0.16% copper in holes 90-1 and 90-2 respectively. These
thick intersections suggest the presence of a large
mineralizing system with low precious/base metal
values. The Pyramid Hill area will be further tested.

Mineralization at the A zone and Zinc Hill occur at
a definite stratigraphic position near the base of an
andesitic volcanoclastic package and in the underlying
interbedded tuff and siltstone. Mineralization at the
West zone is in an underlying felsic volcanic. The
style of mineralization and alteration features exhibit
hydrothermal zonation patterns. The 1990 work has
expanded the target area to at least 500 by 1,500
meters. Additional diamond drilling has been
recommended for 1991. WESTERN CANADIAN MINING CORP.
(MCD-V) owns 67% of Vector's shares. (SEE GCNL No.143,
25Ju190, P.1 FOR PREVIOUS INFORMATION)
