POLYMETALLIC DISCOVERY - Donald R. Sheldon, president, reports Santa Marina Gold Ltd. and joint venture partners have discovered polymetallic values in float boulders and outcrops on the 80-unit Forgold claims located on the southern border of the Noranda/High Frontier/Kennecott GOZ-RDN property about 50 km north of the Prime/Stikine Eskay Creek discovery some 60 miles northwest of Stewart, B.C. Santa Marina can earn a 50% interest by paying MANRIDGE EXPLORATIONS LTD. (MRG-V,M) \$25,000 and spending \$85,000. The property was previously optioned by Manridge from Omega Gold Corp. and Ecstall Mining Corp. The boulders and outcrops were discovered on the east side of the Forrest Kerr fault over a widespread area about 2.5 by 1.0 km

104B General

containing chalcopyrite, sphalerite, galena and pyrite. A total of 116 samples were taken with 58 having anomalous values of greater than 0.05 oz.gold/ton, 1% copper, 1% zinc, 1% lead and 1.0 oz.silver/ton. SEE TABLE ABOVE. (SEE GCNL No.160, 20Aug90, P.3 FOR OTHER PROJECT INFORMATION AND NO.151, Aug.7,1990, FOR MAP)
