<u>CATHDERAL GOLD CORP.</u> (CAT-T) 1990 EXPLORATION REPORT - Pierre B. Lebel, president, reports on this year's exploration activities of Cathedral Gold Corp.

NO.183(1990) SEPTEMBER 21, 1990

At the Takla Rainbow property located in the Quesnel Trough near Germanson Landing, B.C., EASTFIELD <u>RESOURCES LID.</u> (ETF-V) is exploring the claims under an option/joint venture agreement where it can earn a 50% interest by issuing 40,000 shares, paying \$150,000 and spending \$2,850,000 on exploration over four years. Drilling is underway with 10 holes completed and results expected shortly. Previous drilling by Cathedral established probable and possible reserves of 325,000 tons grading 0.25 oz.gold/ton. Eastfield's program is targeted on an untested part of the property where significant copper values were encountered in a small. shallow drill program by Falconbridge in 1971. The current program is designed to test for a large copper/gold deposit.

At the 100%-owned Ato project, also located in the <u>Quesnel Trough near Germanson Landing</u>, the present program of geological, geochemical and geophysical surveys located drill core from 1970 on the property when drilling encountered significant copper values including a 185-foot intersection grading 0.5% copper. At that time the core was not assayed for gold. Of the 185 foot section, 147 feet were sent for gold assaying. The current program is designed to define targets for further drilling.
