SANTA MARINA GOLD LTD. (SMJ-V)
KOALA RESOURCES LTD. (KOR-V)

Santa Marina's exploration program carried out by Orequest Consultants have yielded promising results from the Lehto Creek claims located four km west of the Prime/Stikine Eskay Creek deposit some 50 miles northwest of Stewart, B.C. The property is owned 50% by Santa Marina, 50% by CANADIAN CARIBOO RESOURCES LTD. (CCV-V) Mapping defined a series of parallel gossanous bands trending approximately north-south across the western half of the property, varying from less than five meters to over 20 meters wide exposed for over one km in length and exhibiting a shallow east dip into the hillside. Sampling was difficult due to steep terrain; however, samples were collected from the edge of the gossanous zone. Mineralization consists of malachite staining and locally zoned chalcopryite as disseminations and stringers along with pyrite. Three samples from an intensely fractured and limonitic rock returned 0.305, 0.321 and 1.35 oz.gold/ton. Base metal assays are pending. Additional chip and channel samples are being collected to define the extent of the mineralization. A drilling program is under consideration for late Sept.
