WESTERN CANADIA

MAPLE RESOURCE CORP. (MRZ-V)

TEUTON RESOURCES LTD. (TUO-V)

4J'S EXPLORATION RESULTS - William Campbell, secretary, reports Maple Resource has received results from the first work on the 4J's property, 30 miles northwest of Stewart, B.C. where the company is earning a 60% interest from Teuton Resources Ltd. by paying \$150,000, issuing 200,000 shares and spending \$1,200,000 on exploration over four years.

Grid establishment and soil sampling was done over a large gold-in-soil anomaly discovered by a single line of contour-line geochemical sampling in 1989. The 1990 work resulted in the definition of a linear, north-south trending soil anomaly over a distance of 600 meters. All samples taken within the trend were highly anomalous and five returned values from 0.049 to 0.186 oz. gold /ton. The southern 200 meters of the gold anomaly is coincident with a VLF-EM conductor. There is no outcrop exposure over the soil anomaly, but immediately south and along the projected trend, are veins discovered in 1989 that returned up to 0.19 oz.gold/ton across 5.0 feet. Maple plans diamond drilling to test the anomalous zone prior to the end of this year's field season. (SEE GCNL No.218, 14Nov89, P.1 FOR 1990 RESULTS)
