**HIGH FRONTIER RESOURCES LTD. (HFR-V)**

At the 2,718-acre Moonlight project in the Stikine Arch region 27 miles north of Stewart, B.C., soil sampling and mapping are underway. The project is a joint venture between High Frontier, Kennecott, FEST RESOURCES CORP. (FSC-V) and GOLDEN GLACIER RESOURCES INC. (GGA-V). Work has confirmed a number of well mineralized north-south veins and several east-west fault related shear zones and veins mineralized with quartz-carbonate, base and precious metals. Initial grab samples taken from the showings are listed below:

BARREL VEIN NORTH-SOUTH VEIN STRUCTURE:

SAMPLE NO.	GOLD OZ/T	SILVER OZ/TON	COPPER %	LEAD %	ZINC %
19057	1.557	17.72	1.88	4.98	1.12
19058	.648	8.81	2.70	.34	.061

200E VEIN NORTH-SOUTH STRUCTURE

19059	.547	47.0	1.92	.221	.058
-------	------	------	------	------	------

16A VEIN EAST-WEST VEIN STRUCTURE

19061	1.96	1.34	.173	2.15	10.1
-------	------	------	------	------	------

1ST CREEK N EAST-WEST SHEAR ZONE

23026	.81	20.90	5.20	1.54	1.33
23027	.05	4.11	.558	.43	.06
23028	1.075	26.85	5.48	1.00	.07
23030	.46	2.99	.53	.26	.07
23035	1.149	25.77	3.77	.51	.18
23036	.44	11.22	1.34	.67	.07
23037	.702	43.07	7.79	1.30	1.85
23038	.38	75.87	2.27	.21	.18

The results indicate an epithermal association to the East-West vein shear systems and intrusive dykes and epithermal mineralization.

The property contains numerous high grade gold and silver showings. In 1980, a 1,500-lb. bulk sample assayed 182 oz. silver/ton. Several recent samples returned up to 3.00 oz. gold/ton. A 5,000-foot drill program is being recommended for this project. (SEE GCNL No.151, 7Aug90, P.2 FOR KENNECOTT AGREEMENT)
