B.G.M. DIVERSIFIED ENERGY INC. (BGD-V)

**MT. MILLIGAN ANOMALIES DISCOVERED - Nadia Wakefield,
president, B.G.M.**

Diversified Energy Inc., reports Reliance Geological Services has completed geological, soil geochemical, airborne magnetic and VLF-EM geophysical surveys on the Gold Power and Superior properties located in the Mt. Milligan area of central B.C.

On the 100%-owned Gold Power property, 12 km southeast of the Mt. Milligan deposit, two large east-west trending magnetic highs were identified. Wide spaced soil sampling coincident with one of the highs outlined an anomaly at least 600 meters by 800 meters. Rock sampling returned values up to 1,131 parts per million copper from altered Taki volcanic rocks.

On the 100%-owned Superior property, six km north of the Mt. Milligan deposit, a large high-contrast magnetic high anomaly has been identified. This high is on the northeast flank of the regional magnetic high associated with the Mt. Milligan deposit. One orientation soil line over the area outlined nine copper soil samples that were anomalous (over 50 ppm) along 600 meters which correlates with the magnetic high.

The coincident magnetic and soil anomalies are considered favourable indicators for a buried porphyry copper/gold deposit. Mapping, sampling and induced polarization surveys will start immediately to identify drill targets. (SEE GCNL No.139, 19Jul91, P.3 FOR OTHER INFORMATION)
